## Foreword

*Still Living Without the Basics in the 21st Century* is the culmination of nearly a year of research and analysis that documents the availability of adequate water and sanitation service in U.S. homes. It is based in large part on data from the 2000 decennial census, supplemented by other publicly available information. This publication is a sequel, updating an analysis published in 1995 by the Rural Community Assistance Partnership (RCAP, Inc.) that focused on data from the 1990 decennial census.

In comparing these documents, two points stand out clearly. The efforts of the Rural Community Assistance Partnership – and other agencies and organizations working tirelessly in thousands of small rural communities – have paid off significantly. And still, much remains to be done.

The 1990 census showed that 405,855 rural households lacked complete indoor plumbing. Rural households represented more than half of all U.S. homes that lacked adequate water and sanitation services. By the 2000 census, 226,967 rural households were without complete indoor plumbing, representing about one-third of the national total. This is real progress.

Despite the success to date, more than 600,000 residents of rural communities still do not have the basic water and sanitation services the rest of us take for granted. It is no surprise that they are likely to be economically disadvantaged, ethnic minorities, and geographically isolated.

There is much more to the story, of course. This report also looks at the quality of water and sanitation services and the health consequences of inadequate service. Just as there is much to do, there also is much to learn about the causes and effects of inadequate basic infrastructure.

The research, analysis, and writing for this report was done by Stephen Gasteyer, Ph.D., RCAP's Director of Community Development, and Rahul T. Vaswani, M.A., Research Associate at RCAP. Their work was made possible by grants from the U.S. Environmental Protection Agency's Office of Ground Water and Drinking Water as well as U.S. EPA's Office of Wastewater Management and the U.S. Department of Agriculture Rural Utility Service's Water and Environmental Programs.

As a nation, we have succeeded in bringing proper water and sanitation service to almost every home. What's left is likely to be the most difficult part of making water and sanitation services truly universal.

Randolph A. Adams, Ph.D.  
Executive Director  
Rural Community Assistance Partnership, Inc.

## Executive Summary

### Still Living Without the Basics in the 21st Century

The United States has achieved remarkable success in improving access to modern water and sanitation services for its citizens in the past five decades. Today only 0.64 percent of U.S. households lack complete plumbing facilities. This is a monumental leap from 1950, when more than one-fourth of the nation, and more than half of all rural residents, lacked those facilities. Yet we have more to accomplish – and in more complex ways.

The U.S. 2000 Census reveals that more than 1.7 million people in the United States, 670,986 households, still lack the basic plumbing facilities that most of us have come to take for granted. To some observers, these Americans may appear to be lost or insignificant within the larger population, but the hardships they endure in their daily lives are very real.

It may seem reasonable to assume that people who live in the 21st century with services more characteristic of a bygone era choose to live in places or situations where modern services are not available, or to live in such conditions only temporarily. A closer look at the numbers and trends reveals the opposite. A combination of circumstances – some of them persistent – have excluded these people from the reach of development.

Some of the people affected are the poorest of the poor, living in sparsely populated rural areas or in densely populated urban areas. They live in almost every state from coast to coast – in the vast reaches of Alaska; the urban centers of southern California, New York, and Illinois; the sprawling colonias bordering Mexico; the Indian reservations and counties of the Four Corners region in the West; the underserved rural communities of West Virginia and the New England states. More than a third of them have household incomes below the federal poverty level. In fact, if you were born in 2000 into a family living below the poverty level in the United States, you were four times as likely as a fellow American living above the poverty level to be in a home without adequate indoor plumbing.

These people are spread across all racial and ethnic categories, but they are more prominent in the minority groups. Among American Indians and Alaska Natives, nearly one in 20 households across the nation lacks complete working indoor plumbing. In the state of Alaska alone, one in every 16 households lacks these facilities, and in some boroughs, such as the Bethel Census area, more than half of all Native homes do not have adequate plumbing. Similarly, one in every three American Indian homes in Apache and Navajo counties in Arizona goes without these services. The majority of these homes are rural.

Among Hispanics, the people most affected live in the traditional centers of large Hispanic populations – Los Angeles in California; Miami-Dade in Florida; Harris and Hidalgo counties in Texas; Bronx, Kings, and New York counties in New York – and in the rural areas of New England, the South, and the West, where groups of Hispanics, including immigrants in the past decade, work as agricultural and farm workers.

The largest proportion of African-Americans living without adequate water services is in Montana, where almost 4 percent of African-American households lack complete plumbing facilities. More than 1 percent of African-Americans lacked these facilities in the southern states of Virginia, South Carolina, Mississippi, Louisiana, and Georgia, as well as northeast states such as Rhode Island and Massachusetts.

Native Hawaiian and other Pacific Islanders also often lacked complete facilities in relatively high proportion to their population. For instance, more than 11 percent in Vermont and 10 percent in North Dakota reported lacking services.

A look at the state-level information shows that Alaska has the highest percentage of households without plumbing – 6.32 percent of all its households – and Nebraska has the lowest, with only 0.36 percent of its households. More than half (53 percent) of all households lacking proper plumbing facilities in the United States are concentrated in just one-fifth of the states – California, New York, Texas, Florida, Pennsylvania, Illinois, Arizona, Virginia, Ohio, and North Carolina. This is not surprising because these states also have more than half (52 percent) of the nation’s population and more than half (55 percent) of the people who live below the poverty level. What is surprising, though, is that only half of these states have done better than in 1990 in reducing the numbers of people without adequate plumbing. In the other half, the numbers of households without services have increased.

While the rural-urban divide has lessened over the last five decades – in 1950 it was almost five to one, with 50 percent of rural homes and 11 percent of urban homes lacking plumbing – it still persists at two to one. And with a larger share of rural homes in poverty, rural households are more greatly affected. Today, a poor rural home is two and a half times more likely than a poor urban home to lack proper indoor plumbing. As the home gets more rural – that is, as the population level decreases within the area – the chances of not having such services increase further. In five of the states – New Mexico, Arizona, West Virginia, Kentucky, and Mississippi – half or almost half of the homes that lack adequate indoor plumbing also are below the poverty level.

Disaggregating the picture to look at county-level information gives a clearer understanding of the dynamics of the social and economic variables that affect basic water and sanitation services. The counties that are persistently poor, non-metro, and rural, with a larger share of their populations composed of minority groups, are more likely to have inadequate plumbing services than are urban counties with a more diverse racial and ethnic mix of groups. More important, these inadequate systems pose significant health risks for vulnerable populations. Smaller community water systems that have limited access to the resources they need to enhance these basic services are likely also to be in violation of health and safety standards set by national environmental authorities.

Studies by the U.S. Centers for Disease Control and Prevention have found more outbreaks of waterborne diseases in the United States in the 1999–2000 period than in the previous seven years. U.S. Environmental Protection Agency reports also show that 8.2 percent of the 48,271 community water systems in the United States that serve populations of less than 10,000 were in violation of health and safety standards for drinking water quality in 2003.

Couple these statistics with an aging infrastructure that needs to be replaced or improved, and the recent reductions in spending for programs to enhance water and sanitation services, and we see an imposing and complex situation that will require careful attention and multifaceted solutions in the coming years. The social and economic impacts of this situation are likely to be great, as are the ecological effects of diminishing water supplies in vulnerable areas.

These are only some aspects of basic water and sanitation services in the United States that public policy should be concerned about. Other important aspects involve the efficacy and efficiency of our collection and presentation of information about these services. How we define questions about water and sanitation services in national surveys, and how we tabulate the responses for subsequent analysis and understanding of national realities, are crucial if the resulting reports are to be substantive and meaningful. How we define the categories of “rural,” “urban,” and “poverty”

becomes even more critical when the largest sources of funds – both federal and private – for improving the socioeconomic conditions of people who live in poverty in both urban and rural areas rely on these definitions as they disperse funds and institute programs.

There is an intrinsic link between the quality of basic services such as water and sanitation and the economic opportunities that follow their improvement, especially in communities that are in close proximity to developing urban centers. While we have seen a slight shift in the population from rural to urban in the past decade, the conditions of many rural Americans have not improved, and the quality of their basic services is an important reason.

While the United States has made great improvements in the quality of life for many urban and rural Americans, there is more to be achieved – even in something as simple and essential as bringing safe, clean water and basic water and sanitation services to the entirety of the U.S. populace. The gap has been reduced to less than 1 percent of the entire population in the past century. Now our efforts must focus on closing the gap. This task requires developing a more complex and detailed understanding of the social, economic, and ecological reasons why communities lack these services, and constructing solutions that are not only acceptable and feasible, but also sustainable.

*Still Living Without the Basics* is intended to inform the public's understanding of access to water and sanitation services in the United States and to contribute to the debate on how to structure policy decisions for improving these services, especially for those groups that have been excluded or overlooked in the development process. We hope to build on this research in the near future, further investigating the links between people's access to services and the various social, economic, and ecological outcomes that affect those people.

# Still Living Without the Basics: Analyzing the Availability of Water and Sanitation Services in the United States

## Introduction

For the vast majority of United States citizens in the 21st century, household water has become so readily available that we barely consider it. Turn on the tap, jump in the shower, flush the toilet – we take for granted our access to potable water and modern sanitation and assume that everyone across the country has access to these services. Indeed, almost everyone does – more than 99 percent of U.S. residents, according to the 2000 Census.

Most international health and socioeconomic development institutions, including the World Health Organization (WHO), the United Nations Children's Fund (UNICEF), and the World Bank (WB), simply round up that percentage and report that 100 percent of U.S. citizens have access to developed water and sanitation services.<sup>1</sup> They suggest that the few Americans who lack these amenities are extreme exceptions – exceedingly rare and subject to extraordinary circumstances, probably temporary.<sup>2</sup>

The number of households involved may indeed seem statistically small, at 0.64 percent of all U.S. households. But that 0.64 percent translates into 670,986 households, representing more than 1.7 million people<sup>3</sup> who lack complete plumbing facilities (Table 1).<sup>4</sup> This is the number of people who are falling through the cracks. Makers of public policy – urban and rural, social and economic – need to focus on these 1.7 million and their needs.

These numbers are indicative of larger and more severe realities that policy makers often overlook or fail to comprehend. Beyond those people who live without access to proper plumbing services, increasing numbers of people live in areas where the groundwater they use for household purposes is contaminated or where the supply of water is dwindling because of water losses and overuse. Even communities that have had piped water for some time are now confronting the reality of having to replace or upgrade aging infrastructure and water treatment facilities that no longer comply with U.S. Environmental Protection Agency (USEPA) health and safety regulations.<sup>5</sup>

Drawing on data from the U.S. Census surveys of 1990 and 2000 and other related sources, this report describes some of the characteristics of the people who still live without access to basic water and sanitation services in the United States. It tries to answer some elementary questions: What is

<sup>1</sup> See, for example, the water and sanitation statistics available for the United States on the WHO and UNICEF websites at [http://www.who.int/docstore/water\\_sanitation\\_health/Globassessment/Global11-2.htm](http://www.who.int/docstore/water_sanitation_health/Globassessment/Global11-2.htm) or [http://www.who.int/water\\_sanitation\\_health/monitoring/en/Glassessment11.pdf](http://www.who.int/water_sanitation_health/monitoring/en/Glassessment11.pdf) – page 3, and at [http://www.childinfo.org/eddb/water/Euroam/usa\\_water1.pdf](http://www.childinfo.org/eddb/water/Euroam/usa_water1.pdf).

<sup>2</sup> “Americans” in this report refers only to U.S. citizens, U.S. residents, or U.S. nationals, any of whom reside in the 50 states and the District of Columbia, and, where specified, in Puerto Rico and the Island Areas (the U.S. Virgin Islands, Guam, American Samoa, and the Northern Mariana Islands).

<sup>3</sup> These statistics include information from only the 50 U.S. states and the District of Columbia. They are tabulated from the responses to Item 39 of the Long Form of U.S. Census 2000.

<sup>4</sup> It is important to note that the U.S. Census definition of “lacking complete plumbing facilities” is the lack of any of the following services within the housing unit: (a) hot and cold piped water, (b) bathtub or shower, (c) flush toilet. This definition has been more or less consistent since 1970. We take this definition to be equivalent, for purposes of this report, to the more general understanding of what constitutes basic water and sanitation facilities. See also the section on information gaps in this report for a better understanding of the limitations of information on plumbing and sanitation facilities.

<sup>5</sup> For more information, see USEPA, *The Clean Water and Drinking Water Gap Analysis*, Office of Water (4606M) EPA-816-R-02-020, 2002, or [www.epa.gov/safewater](http://www.epa.gov/safewater). Also see West Central Initiative, *Infrastructure for West Central Minnesota Communities*, West Central Initiative, Fergus Falls, Minnesota, 2002, or [http://www.wcif.org/publications/pdf/infra\\_2003/infrastructurestudy2003.pdf](http://www.wcif.org/publications/pdf/infra_2003/infrastructurestudy2003.pdf); accessed May 2, 2004.

the number of households and people lacking these services? What regions, states, and counties are home to these people? Do these people tend to live more in rural or urban areas? What are their ethnicities? What is their socioeconomic status? The report also tries to address some key policy questions that arise from this analysis: How have the numbers of people living without services changed over time – particularly in the past decade? What has contributed to this change? What is the relationship of water and sanitation services to other basic services? What do policy makers need to understand more clearly about this information to make further improvements in the availability of water and sanitation services? What efforts need to be taken in this direction?

## Methodological Layout of the Study

This report provides an analysis of the access to complete plumbing facilities in the United States – the 50 states, the District of Columbia, Puerto Rico, and the Island Areas (the U.S. Virgin Islands, Guam, American Samoa, and the Commonwealth of Northern Mariana Islands).<sup>6</sup> Where possible, the analysis looks beyond the U.S. Census levels to cover regional, state, and county place levels as well.

The basic research for our analysis was done in two parts.

### *Part I of the Analysis*

In the first part, we relied entirely on the information provided by the U.S. Census for 1990 and 2000, and undertook our research in four successively complex stages.

The first stage involved collecting data and arranging it for subsequent analysis. This stage included determining how the demographic and socioeconomic data relate to each other. We did this primarily at the state and national levels and disaggregated it across six of the eight major race and ethnicity categories used in the Census 2000 survey. The categories included in this study are the six races of “White,” “Black or African American,” “American Indian and Alaska Native” (AIAN), “Native Hawaiian and Other Pacific Islander” (NHOPI), “Asian,” “Some Other Race,” and the ethnic category of “Spanish/Hispanic/Latino.”

In the second stage, we analyzed the data down to the county level<sup>7</sup> for the 50 U.S. states, the District of Columbia, and Puerto Rico, and to the Census-designated place (CDP) level for the Island Areas. In the case of the four Island Areas, we made this change in geographic level, from county to CDP, to obtain a more meaningful representation of information at a disaggregated level. At both of these substate geographic levels, we analyzed the data for the number of households and the number of people lacking complete plumbing facilities. Where possible, we also tracked the breakdown of these numbers for the six race and ethnicity categories listed above. This was not always possible, because the size of some counties is so small that the Census Bureau does not release information about housing and population characteristics in order to maintain the confidentiality of the respondents.

In the third stage, we determined the possible lack of adequate water and sanitation facilities for households and people disaggregated by race and by ethnicity, in urban and rural areas, at both the

<sup>6</sup> The District of Columbia, Puerto Rico, and the Island Areas are each treated as the statistical equivalent of a state for U.S. Census purposes. However, figures quoted by the U.S. Census Bureau for the United States as a whole include numbers for the District of Columbia but not for the other equivalent states, and this report treats those figures the same way unless otherwise stated in the text.

<sup>7</sup> While tabulation of data below the county level was not practical for this endeavor, we fully recognize the limitations of county data, specifically for recognizing rural/urban differential. Urban counties in the West often contain rural places.

state and the county or CDP levels. This gave a clearer picture of how the numbers were geographically placed.

In the fourth stage, we determined the correlation between the lack of adequate water and sanitation facilities and the level of poverty, at both the state and county or CDP levels. We also did these correlations with similar information available for the race and ethnic categories above, and for households in urban and rural areas.

Using ArcView Geographic Information System (GIS) applications, we mapped our findings for the states, counties, and CDP areas, showing the percentages and absolute numbers of households and people lacking adequate water and sanitation services.

### *Part II of the Analysis*

In the second part of our analysis, we took information from additional data sources to help us address some of the important questions that either were based on the assumptions that led to our analysis or arose in the process of the research itself. For this we used the following sources:

- The Safe Drinking Water Information System (SDWIS) datasets of the USEPA to find the relationship between the number of people without access to services and the size, ownership, and health safety violations of small community water systems.
- Data from the Advanced Query Data Finder of the U.S. Census Bureau to find the relationship between the lack of complete plumbing facilities and the cost of water and sanitation services in rural and urban locations across the United States.
- The information compiled in the first part of our research at the state and county levels, the correlations determined above, and other available socioeconomic and demographic indicators to develop hypotheses about certain areas that have a relatively higher number or percentage of households reporting lack of water and sanitation services. This was necessary to understand the underlying causes for the lack of adequate water and sanitation services in different socioeconomic and demographic conditions.

Using the methodology described above, we were able to determine how many households or people of any race or ethnic group do not have access to complete plumbing facilities, at the state and county levels, in both urban and rural areas. We were also able to determine some important correlations between the lack of complete plumbing facilities and other variables, such as these:

1. The poverty level in each of these states and counties, and likewise in each of the urban and rural areas in each state and county.
2. The monthly cost of water and sewer facilities per household.
3. The health safety violations of codes and regulations that occur in the small community water systems serving these households in each county.

Our analysis has helped us better understand, and at the same time has affirmed some of our pre-analytical assumptions on, the relationships between economic conditions, geographic location, conditions of infrastructure, and kinds of communities. More important, these understandings have helped us identify some of the resources, services, and assistance underserved communities need in the coming years to meet the gap in water and sanitation infrastructure.

## Information Gaps

In the course of our research, we encountered some important information gaps that readers of this report should be aware of as they try to understand the analysis.

- Not all people answering the U.S. Census Long Form interpreted the question about plumbing services in the same way.<sup>8</sup> For instance, the 2000 Census revealed that more than 1,100 households, or more than 3,200 people, in Fairfax County, Virginia (a relatively affluent suburb of Washington, D.C.), lacked complete plumbing services. This finding raises the possibility that some responses were not what the Census question intended to elicit. Some respondents, for instance, may have noted that they lacked complete plumbing services when those services were in fact available to them but had been turned off for lack of payment – presumably a temporary condition, not a permanent one. While we view this issue as critically related to our concerns, it is beyond the scope of this report. It is worth noting here, though, that other organizations have increasingly focused on how the inability to pay affects people's access to water services, whether temporarily (as when water is cut off for nonpayment) or permanently.<sup>9</sup>
- It is possible that many people who probably lack access to basic services were not included in the Census. Among these people may be the homeless in the United States, as well as immigrants or migrant laborers who might have worried about responding to the Census data collectors out of fear that the information would be turned over to law enforcement or immigration authorities. While the Census Bureau maintains confidentiality of the data it collects, the fact that the bureau is part of the U.S. government can make it suspect in the eyes of many people in such categories.
- Several key questions about plumbing and sanitation facilities were eliminated from the U.S. Census questionnaires between 1990 and 2000. These included data about the source of water, the type of water and wastewater facilities, and water system ownership. In the U.S. 2000 Census, they exist only in the questionnaires distributed in the Island Areas. If they had been included in all of the questionnaires, these questions would have allowed for a more detailed analysis of not only the numbers of people lacking plumbing and sanitation services but also the population living with inadequate water services.<sup>10</sup>
- Because of confidentiality considerations in small counties and inconsistencies between the data available from the U.S. Census Bureau and data from the State Drinking Water Information System, wherever possible we concentrated our correlations on the counties whose information appeared in both databases. The same is true for correlations between U.S. Census information and the data taken from the query results of Advanced Factfinder. For example, the correlation between the lack of plumbing facilities and the monthly cost of water and sewer facilities was possible for only 2,336 of the total 3,219 U.S. counties.<sup>11</sup>
- The definition of "urban" and "rural" changed between the 1990 and 2000 U.S. Census surveys. Thus, the information for these categories is not directly comparable between the two surveys.<sup>12</sup> Nonetheless, we have shown the comparative data from the two years in our ranking tables to give readers a general idea of the magnitude of changes in "urban" and "rural" numbers between the two censuses.

<sup>8</sup> See the glossary at the end of this report for a description of the Long Form.

<sup>9</sup> See the work of Public Citizen and the Welfare Rights Association on water cutoffs in Detroit, Michigan ([www.citizen.org/facts/detroit](http://www.citizen.org/facts/detroit)), and the report of the National Drinking Water Advisory Council on water system affordability ([www.epa.gov/safewater/ndwac/affordability](http://www.epa.gov/safewater/ndwac/affordability)).

<sup>10</sup> The distinction here is among drinking water, water for other household purposes, and sanitation/sewer facilities.

<sup>11</sup> The total number of counties (municipios, in the case of Puerto Rico) for the 50 U.S. states, the District of Columbia, and Puerto Rico is 3,219.

<sup>12</sup> For a more detailed description of "urban" and "rural," see the glossary at the end of this report.

## Report Findings and Discussions

In this report we cover the following related issues:

- Households and populations without access to basic water and sanitation services, mapped by each state and down to the county level where possible.
- The breakdown of the population living without these services by race/ethnicity – specifically for the six race/ethnicity categories included in this report – at the state and county levels.
- An analysis of rural-urban differences and similarities related to lack of these services.
- Public health implications of not having access to basic water and sanitation services.
- Factors that influence access to water and sanitation in the United States.
- Steps that are being taken to address these issues.
- Key issues for rural water infrastructure.
- Key program and policy concerns related to these issues.

We provide county-level information tables and GIS maps representing the numbers of households in each county that lack access to complete plumbing services. We have used information from the U.S. Census to document these numbers. We have correlated this information with data from SDWIS and discussed some of our findings, where applicable. While we clearly have not exhausted the data available on water and sanitation, we hope this report will contribute to an understanding of the work still to be done in the United States on this issue.

### How Many People in the United States Live Without Basic Water and Sanitation Services?

The United States has made great progress over the past 50 years in providing its residents with access to improved water and sewer facilities. In 1950, 27 percent of all households in the country lacked access to complete plumbing facilities. The rural-urban divide then was more substantial – close to a five-to-one ratio. More than 50 percent of rural households and 11 percent of urban households lacked these services in 1950. Significant rural infrastructure investments by the federal and local governments through the 1950s and 1960s led to a dramatic decrease in the households without proper plumbing facilities. By 1970, only 5.9 percent of all U.S. households lacked piped water, although the ratio of rural to urban still remained close to five to one (14.5 percent of rural and 3.1 percent of urban households lacked proper plumbing facilities in 1970).

**Table 1: Percentage of Occupied Housing Units Lacking Complete Plumbing Facilities, 1950–2000<sup>13</sup>**

% of occupied housing units lacking plumbing (U.S.)	1950	1960	1970	1980	1990	2000
Rural	56	31.5	14.5	4.5	1.9	1.0
Rural – farm <sup>14</sup>	55	NA	NA	3.9	NA	1.2
Urban	11	8.2	3.1	2.2	0.5	0.5
Total	<b>27</b>	<b>14.7</b>	<b>5.9</b>	<b>2.7</b>	<b>0.78</b>	<b>0.64</b>

<sup>13</sup> U.S. Bureau of the Census, Census of Housing 1950, Washington, D.C., Government Printing Office, 1952; Census of Housing 1960 (1962); Census of Housing 1970 (1972); Census of Housing 1980 (1982); Census of Housing 1990 (1992); Census of Housing 2000 (2002). Also see Dennis Warner and Jaris S. Dajani, *Water and Sewer Development in Rural America: A Study of Community Impacts*, Lexington Books, Lexington, Massachusetts, 1975.

<sup>14</sup> The “Rural” category includes all *non-farm and farm* households. The “Rural – farm” category includes all households located in a rural farm area and concerned with growing crops or raising livestock.

By 1990, the United States had installed basic plumbing infrastructure for more than 99 percent of its citizens. Most of the people who lacked plumbing services were elderly, poor, and living in rural areas.<sup>15</sup> Rural households were still four times as likely as urban households to lack proper plumbing. By the 2000 Census, only 0.64 percent of occupied households lacked complete plumbing facilities (Table 2). Indeed, the percentage was low enough in 2000 that UNICEF stated in its global reports on access to water and sanitation services that the United States had 100 percent water and sanitation coverage. While the 0.64 percent may appear to be statistically insignificant, it represents more than 1.7 million people across the country, most of whom are the hidden poor – people who live in rural, and often underserved or marginalized, areas that lack the services that most Americans take for granted. The rural-urban divide is still at two to one – a rural household is twice as likely as an urban one to have inadequate plumbing facilities in the United States (Table 2).<sup>16</sup> U.S. Census 2000 figures suggest that more than 1.1 million urban citizens (equal to 0.5 percent of the total urban population) and more than 600,000 rural citizens (equal to 1.04 percent of the total rural population) still lack proper plumbing facilities.

**Table 2. Total and Percentage of Occupied Housing Units Lacking Complete Plumbing Facilities, 1990–2000**

Census Year	Occupied Housing Units Lacking Complete Plumbing Facilities					
	Total	Percentage	Total – Rural	Percentage – Rural	Total – Urban	Percentage – Urban
2000	670,986	<b>0.64</b>	226,967	<b>1.03</b>	444,019	<b>0.53</b>
1990	721,693	<b>0.78</b>	405,855	<b>1.85</b>	315,838	<b>0.45</b>

### Who Are the People Living Without Basic Water and Sanitation Services?

The people who lack these basic services live in some of the most productive farmland in the United States, along the U.S.-Canada and U.S.-Mexico borders, on Indian reservations, and in the states of the South and the Southeast. They are people working and living in rural and urban areas with dilapidated or nonexistent infrastructure. The Census 2000 data show that 0.64 percent of all occupied households in the country lack adequate plumbing (see Maps 1 and 2). This translates to 670,986 households in the 50 states and the District of Columbia, or more than 1.7 million people. When the numbers for Puerto Rico are included, the total households lacking plumbing increase to 736,626, and the number of people lacking these services increases to more than 1.95 million.<sup>17</sup> In addition, 11,033 households and an estimated population of 47,800 in the Island Areas lack complete plumbing facilities; this calculation brings the total figure close to 2 million U.S. residents.<sup>18</sup>

<sup>15</sup> See *Still Living Without the Basics: A Report on the Lack of Complete Plumbing That Still Exists in Rural America*, Rural Community Assistance Program, Washington, D.C., 1995.

<sup>16</sup> It is important to note that the U.S. Census 2000 survey does not have a precise definition of what constitutes “rural” areas. Rather, it goes about defining urban areas, accounting for core areas, urbanized areas, and urban clusters differentiated by population density, proximity to metropolitan centers, and so on. What is left is given the status of “rural.” The 1990 Census found 62 million people living in rural parts of the country. The number dropped by about 5 percent in the 2000 Census, although the total U.S. population increased by about 13 percent. It is likely that at least some of this decrease results from the change in the definition of what constitutes “rural” between the 1990 and 2000 Censuses, rather than from socioeconomic changes in that decade.

<sup>17</sup> This figure of more than 1.95 million is obtained from the Advanced Query Data Finder of the Census Bureau and corroborates to the population estimates obtained from the Summary File 3 of the U.S. Census 2000 survey.

<sup>18</sup> The U.S. Census information does not include the numbers for Puerto Rico or the Island Areas in its tabulations of the total households and people lacking complete plumbing facilities.

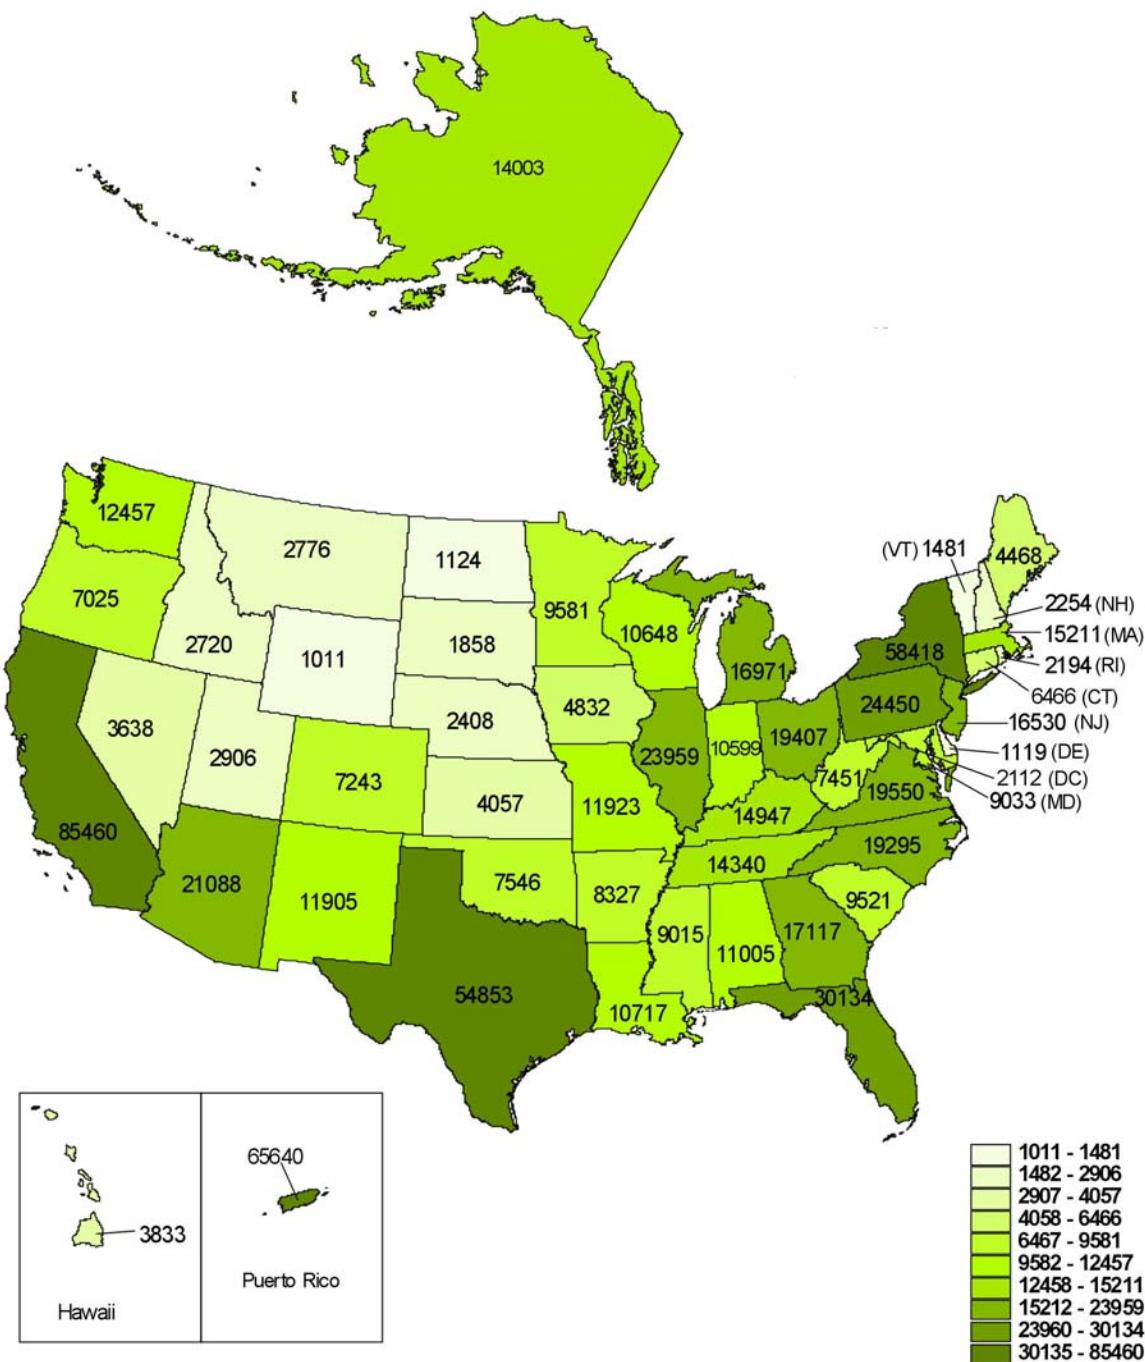

### Rural – Urban Divide

When we break down the numbers and percentages of households lacking proper water and sanitation services among rural areas, rural places with populations of less than 1,000 and rural farm populations have the highest percentage of homes lacking services, well above the national average of 0.64 percent. In the case of urban areas, the highest percentage of households lacking these services is in the most densely populated urbanized areas (those with populations of 5 million or more) and in the fringe areas of urban clusters that are adjacent to rural areas and have populations ranging from 2,500 to 4,999. The relative difference in lack of services between urban and rural areas ranges from about 1.5 to 3 times, depending on the population level of the area (Table 3).

**Table 3. Households and Population in Rural and Urban Areas Lacking Complete Plumbing Facilities, 2000**

Geography	Occupied Housing Units Lacking Plumbing Facilities		
	Total	Percentage of Total Households	Estimated Population Lacking Plumbing <sup>19</sup>
United States as a whole	670,986	<b>0.64</b>	1,737,814

Urban – in an urban cluster of 2,500 to 4,999	9,540	<b>0.54</b>	23,659

<sup>19</sup>The estimated population is calculated by multiplying the number of households lacking plumbing facilities by the average household size for that category (as given in Summary File 3 of the U.S. Census 2000 survey).

**Map 1. US: Total Occupied Housing Units Lacking Complete Plumbing Facilities**

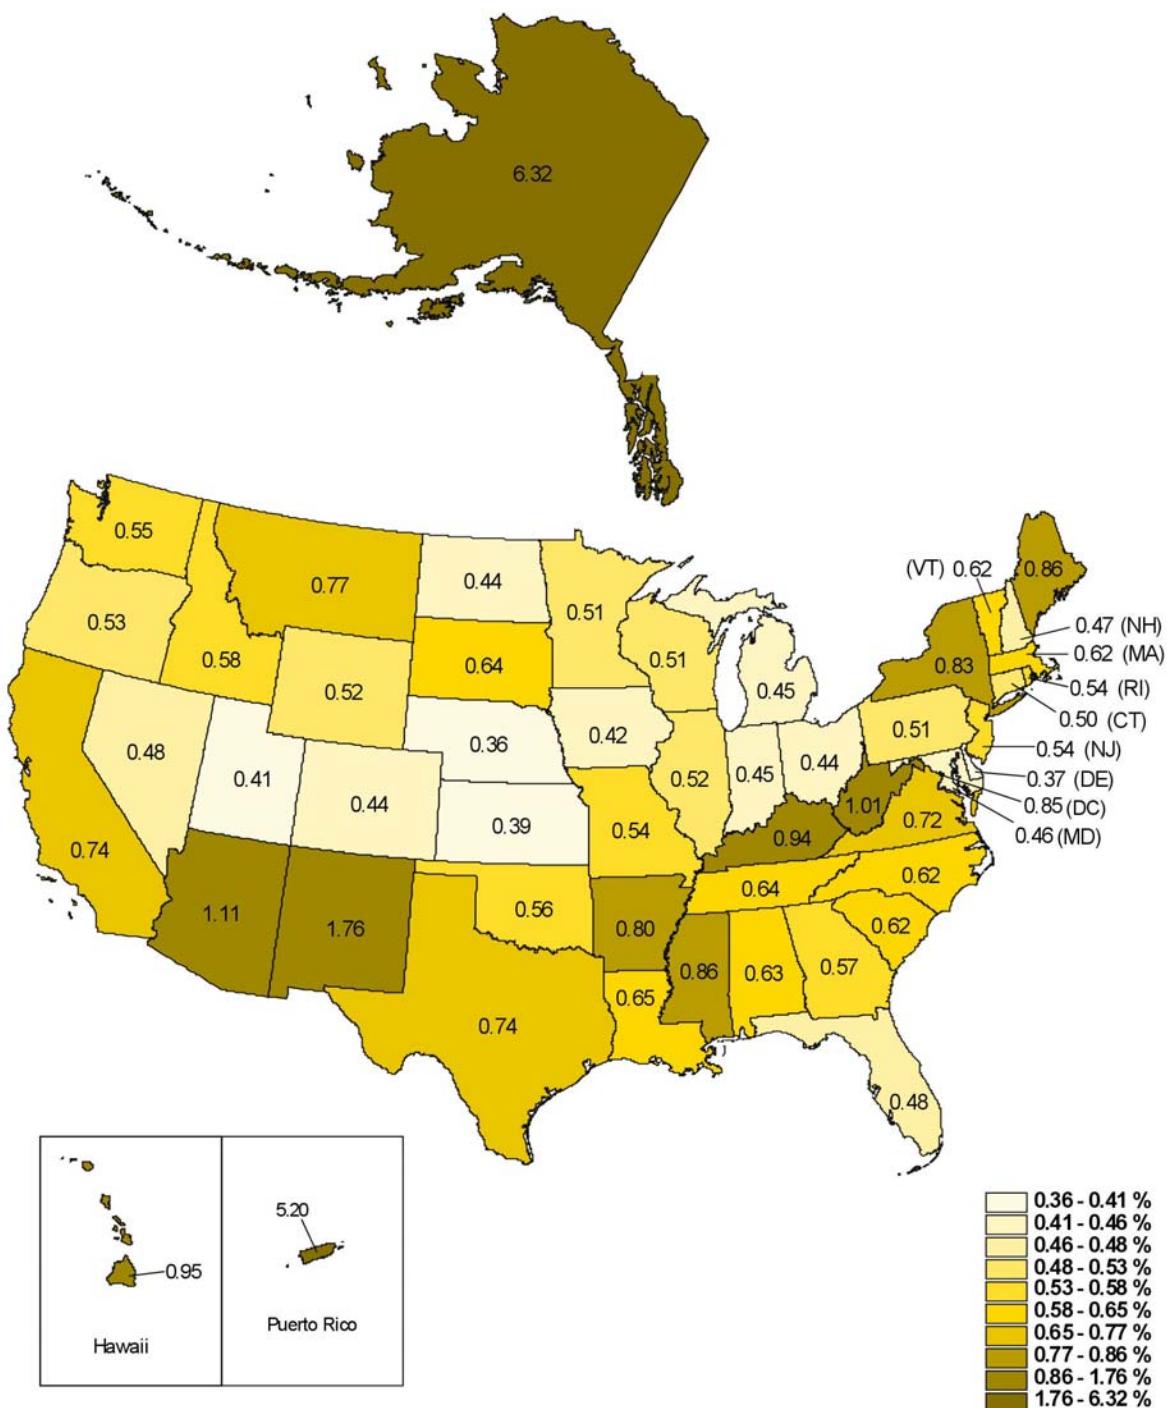

**Map 2. US: Percent of Occupied Housing Units Lacking Complete Plumbing Facilities**

Table 3 shows that rural areas generally have a higher percentage of the population lacking plumbing. Within rural households, the proportion of those lacking plumbing is highest in communities of fewer than 1,000 residents and among farm households. For urbanized areas or urban clusters, the trend is different. Within urban areas, the most densely populated areas (those of 5 million or more) have the highest percentage lacking services – 0.80 percent. The percentage drops steadily as the population size of the urban area decreases, reaching 0.41 percent of households lacking proper plumbing in urban areas of only 50,000 to 99,999 people. In the smaller, urban cluster category, the percentage rises as the population decreases – from 0.43 percent in larger clusters of 25,000 to 49,999 people, to 0.54 percent in the smallest urban clusters of 2,500 to 4,999 people.

Rural areas have traditionally been the most difficult to reach with water services, because they lack the economies of scale to support such services without subsidization or they lack the technical assistance and financing. A total of 226,967 rural households lack adequate plumbing, which includes 13,172 rural farm households.<sup>20</sup> Despite the rise in American economic and living standards with the boom in agricultural capacity, it is clear that rural-farm households remain some of the most deprived in the nation in terms of basic services. The relatively high percentage of those lacking services in the highly urbanized areas is presumably the result of two factors: low-income populations living in substandard housing and people reporting water cutoffs as lacking plumbing facilities. In either case, more research may be needed to identify the reasons for this statistic.

#### *Analysis by Race and Ethnicity*

The figures for the percentage of households and the total population lacking complete plumbing facilities vary greatly by race and ethnicity. Among race categories, American Indians and Alaska Natives (AIANs) have the greatest percentage of households nationwide lacking complete plumbing facilities, at 4.41 percent or 33,781 of their households (Tables 4 and 5, Maps 3 and 4), and Whites have the lowest, at 0.47 of their households. Alaska has the highest percentage of households without services – 6.32 percent – with the proportion in rural areas more than 18 percent. More than half of all rural AIAN communities in the Bethel, Nome, Wade Hampton, and Yukon-Koyukuk census areas, for example, do not have services. More than a third (38.79 percent) of all rural AIAN communities across Alaska live in similar conditions. This is in part because of the isolation of much of Alaska from modern infrastructure and the resulting cost of installing water services, which most Alaska Native communities are unwilling or unable to bear. It is also a result of the geology of Alaska, because the severe cold makes drilling and maintaining water lines difficult. While many Alaska Natives have said that they would prefer living without services to dealing with the problems of piped water, there are increasing efforts to improve sanitation services. This situation is described this way:

Many rural Alaskans live without running water and flush toilets. The basic sanitation needs in nearly one-half of Alaska's 192 Native villages have yet to be met. Another 76 rural communities are not considered to be Native villages; however, the Federal Field Work Group on Alaska Rural Water and Wastewater Sanitation Issues reported in 1995 "sanitation facilities in a number of these communities are known to be similar to those of Alaska Native villages." The work group, which was commissioned by Congress, reviewed the social-economic factors contributing to sanitation inadequacy and noted that one-fourth of Alaska's Native residents "live without running water and use plastic buckets for toilets." In

---

<sup>20</sup> Of the 670,986 households lacking complete plumbing facilities in the United States, 444,019 are urban households and 226,967 are rural households. See Tables 2 and 3 in the text.

many villages, residents must haul water to their homes. Due to the high need for housing, many homes are constructed without adequate sanitation facilities being available to connect homes or provide safe running water or proper sewage disposal. Communities are often faced with having to make difficult decisions between adequate housing and adequate sanitation.<sup>21</sup>

The American Indians living without complete plumbing services are most numerous in the reservations and pueblos of New Mexico and Arizona. An investigation of the county-level information indicates that this ethnic group is most affected in the Four Corners area of New Mexico and Arizona – in other words, on the large Hopi, Navajo, and Apache Reservations. In Arizona, for instance, 35 percent of American Indians in Apache County and 27 percent in Navajo County lack adequate plumbing. Significant numbers of American Indians do not have basic services in areas such as the Pine Ridge Reservation of South Dakota, which covers three counties – Bennett, Jackson, and Shannon – where 2.49, 2.65, and 12.96 percent of households, respectively, report not having complete plumbing facilities.

The Some Other Race (SOR) category is a catch-all category chosen by those who feel that their race is not represented in the other six race categories. Based on an evaluation done by the U.S. Census Bureau, more than 95 percent of those who filled in this category are of Mexican, Panamanian, Caribbean, Central American, and/or South American origin.<sup>22</sup>

**Map 3. US: Total American Indian and Alaska Native Occupied Housing Units Lacking Complete Plumbing Facilities**

**Map 4. US: Percent of American Indian and Alaska Native Occupied Housing Units Lacking Complete Plumbing Facilities**

Hispanics (including Puerto Ricans) are the next largest group, at 1.47 percent (or 134,723 households) (Maps 5 and 6). More than 64,000 of these households are located in Puerto Rico. Another 36,505 are in California, and 28,157 are in Texas. The largest numbers of people living without services are in the urban, coastal, southern California counties of Los Angeles and San Diego. The counties with the highest proportions of people living without services, though, are in California's Central Valley, a lucrative agricultural area with many farm workers from Central and South America. These workers often struggle for a meager living, and large numbers of them remain persistently poor and without access to basic services. The Texas population is from the colonias along the Mexican border, where the lack of water and sanitation stems from a combination of land tenure problems, poverty, and unresolved immigration status. The USEPA has described the situation as follows:

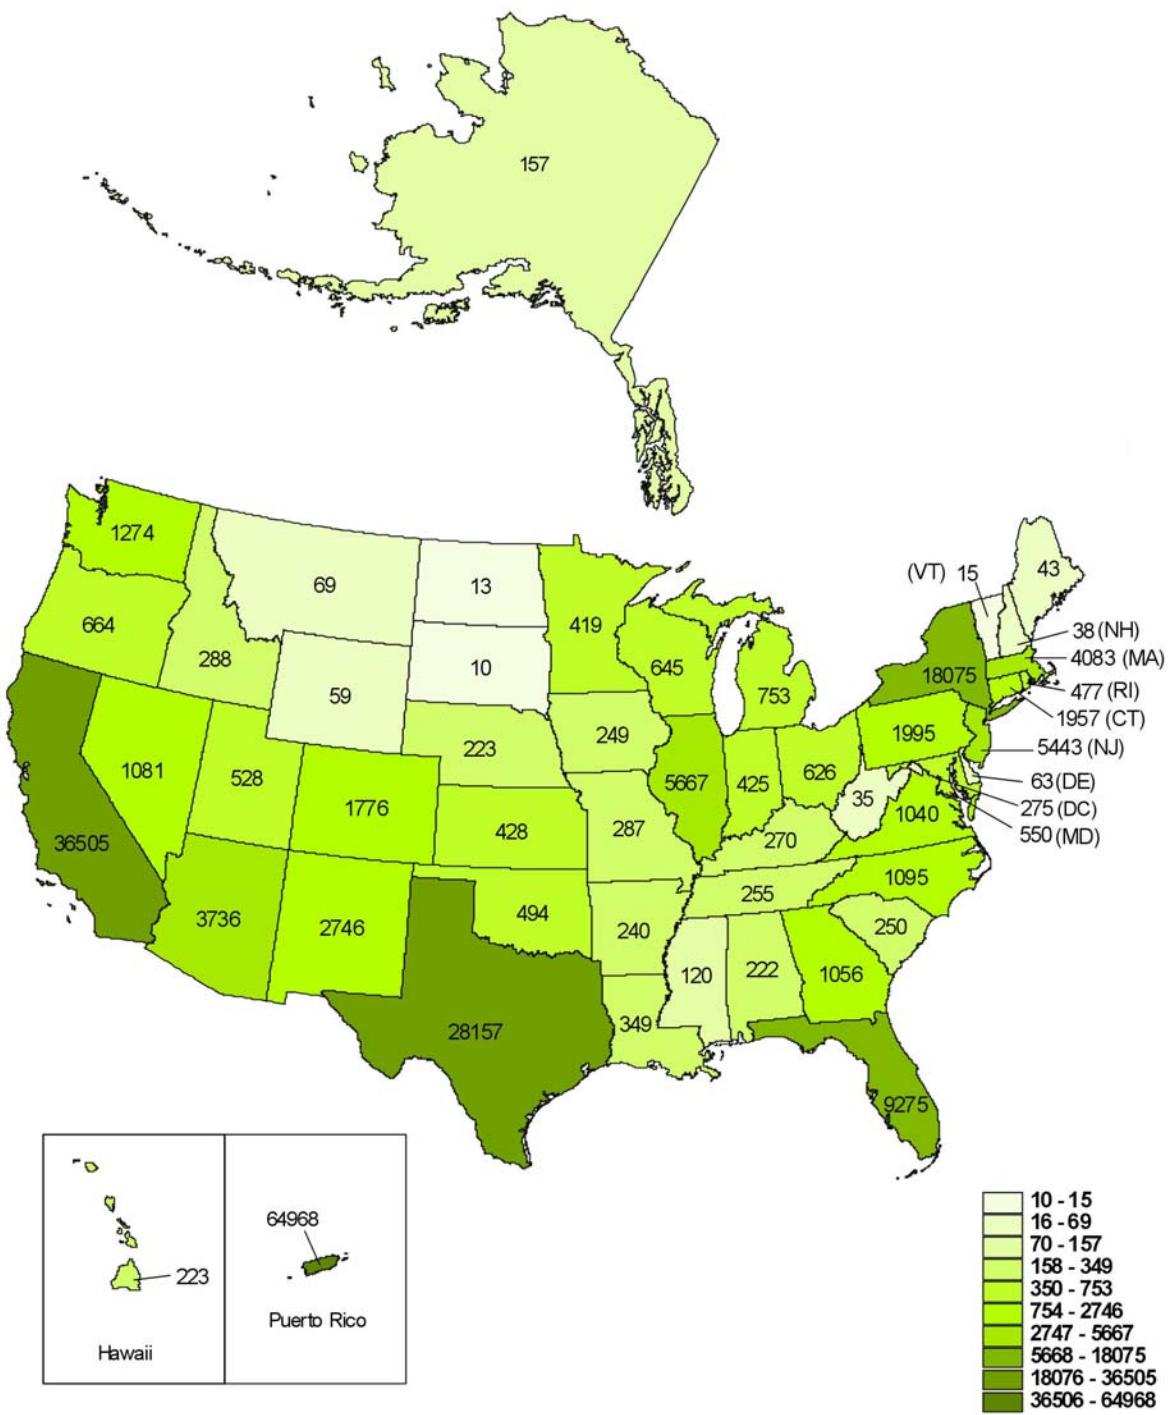

There are more than 1,300 “colonias” in Texas and New Mexico along the border with an estimated population of more than 300,000. A few colonias may exist in Arizona and some possibly in California. However, most colonias are concentrated in the Las Cruces, New Mexico, El Paso, Texas, and the lower Rio Grande Valley area, and west surrounding Brownsville, Texas. Colonias developed in the border area (especially in Texas) as land developers sold small plots of land in unincorporated subdivisions to low-income families. These land purchases are generally financed with a low down payment and low monthly payments. A deed of ownership is rarely transferred. At the time this activity took place, State law only required road access and drainage. Providing solutions to public health problems in the colonias is a unique situation in that they are not political subdivisions. Financial programs are normally designed to deal with an identified political entity. The typical colonia does not have any basic community infrastructure such as safe drinking water, sewage disposal, or garbage collection and disposal.<sup>23</sup>

In absolute numbers of people lacking complete plumbing facilities in the country as a whole, the White race category has the highest numbers, with more than 950,000 people, followed by Hispanics at more than 475,000 people and Black or African Americans at more than 350,000 people. On analyzing these numbers more closely at the county level, we find that for the race/ethnic categories of White, Black or African Americans, Asian, and Hispanic, more than 96 percent of all households lacking plumbing in the top 10 counties for each race category in the nation are urban households. This is starkly different for the race category of AIAN. More than 96 percent of all AIANs lacking plumbing facilities in the top 10 counties are rural. For the NHOPPI category, two-thirds of the homes in the top 10 counties are urban, and the rest are rural.<sup>24</sup>

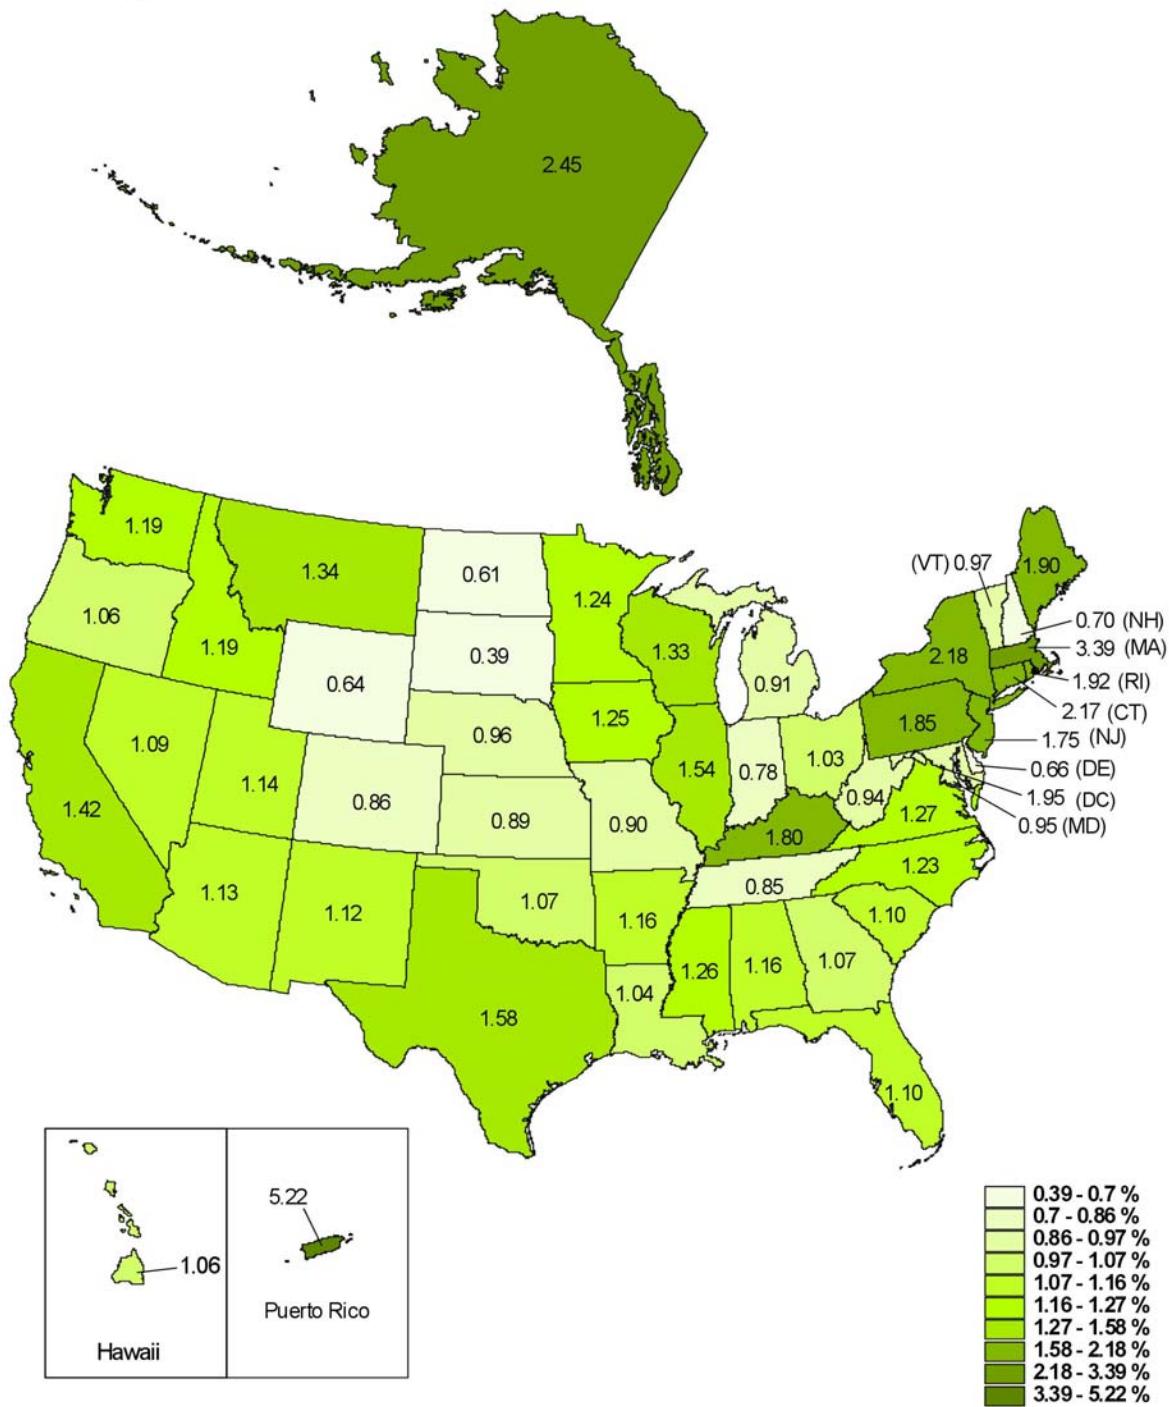

<sup>23</sup> U.S. Environmental Protection Agency, *U.S. Mexico Border: Colonias Fact Sheet*, USEPA, Washington, D.C., 2003, <http://www.epa.gov/owm/mab/mexican/clnfcts.pdf>, accessed May 2, 2004.

<sup>24</sup> It is important to note that the numbers for households lacking complete plumbing facilities in the top 10 counties in each race/ethnicity category represent a substantial percentage of the total households lacking services for each of these race/ethnicity categories. For example, the top 10 counties for AIAN, NHOPPI and Asian race categories have 60 percent, 50 percent, and 45 percent, respectively, of the total households lacking plumbing in these categories all over the nation.

SOR	MA	3.61	AK	3.46	ME	3.09	DC	3.04	CT	2.61
Hispanic	MA	3.39	AK	2.45	NY	2.18	CT	2.17	RI	1.92

The percentages for each of the race/ethnic groups lacking services vary widely geographically. A critical commonality for all minority race/ethnicity groups except AIAN is that the states where they have the highest percentage without water services is where they have a smaller population (Table 5). The highest percentage of Hispanic households with inadequate plumbing is located in the urbanized northeastern states and Alaska, where the population of Hispanics is relatively low. The majority of AIAN households lacking plumbing are located in Alaska, as discussed above, and in the predominantly Indian and rural, underserved counties of the west in Arizona, New Mexico, and Utah. The highest percentage of Blacks without services is in Montana, which has a very low Black population. More than 1.5 percent of Blacks in Rhode Island, which also has a small Black population, reported lacking water services. The percentages of Blacks without services were also high in the persistently poor, predominantly African American counties of Mississippi and Virginia. The case of Bayview, Virginia, in Northampton County, is illustrative.

On a sun-kissed afternoon, Victoria Cummings fetches her 5-year-old daughter, Kadijah, from the Head Start bus stop up on the asphalt road....Once home, Kadijah exerts her tiny biceps by pumping a dishpan full of off-color rust-flavored water from the outdoor hand pump that her mother will use for her "bath." Cummings plans a trip to the store to buy bottled water for drinking and cooking with her food stamps. Her 12-year-old, Latoya, gets home about 3:30 p.m., and Cummings leaves shortly after that for her night-shift job cutting fat off plucked chickens....The small settlement of Bayview sits on a peninsula across the Chesapeake Bay from the rest of Virginia. One in a string of Eastern Shore communities settled by freed slaves, it slowly has sunk into abject poverty in a state where much of the economy hums with the promise of the next century. Bayview's 114 residents are among the most impoverished in what, by some measures, is Virginia's poorest county....Cummings's dream is simple: "Water – running water – inside the house," she says.<sup>26</sup>

It is notable that through community initiative and collaboration with multiple government and nongovernment organizations, Bayview is installing new housing and water facilities. Over time, collective action has improved the situation.<sup>27</sup>

When we look at the states where minority groups are concentrated in large numbers, though, we find that they constitute a predominantly large share of the people in the state who lack complete plumbing facilities. For example, in Mississippi, Louisiana, South Carolina, Georgia, Maryland, and

<sup>25</sup> Puerto Rico has some of the highest rates of households lacking complete plumbing facilities, for all race and ethnic categories (White 4.88%; Black 6.76%; AIAN 9.29%; Asian 5.84%; NHOPI 16.24%; Hispanic 5.22%), but it is not listed in the table, in keeping with the convention used in this report, as explained earlier.

<sup>26</sup> Sylvia Moreno, "In the Spotlight, A Community's Poverty," *Washington Post*, May 10, 1998, page A1.

<sup>27</sup> Anne Raver, "Town of Worn Bootstraps Lifts Itself Up," *New York Times*, August 21, 2003, Section F, page 1.

Alabama, where Blacks constitute more than 25 percent of each state's total population, more than half of all people who lack plumbing in each of these states are Blacks (Table 6). This is similar for AIAN and Hispanic race/ethnicity categories (Tables 7 and 8). The AIAN populations in Alaska, New Mexico, and Arizona comprise from about 5 percent (in Arizona) to just over 15 percent (in Alaska) of the state population, but well over half of all people lacking plumbing in each of these states are from the AIAN race group.

## In Which States Are Basic Water Services Most Lacking?

### *State-Level Analysis*

Fourteen states, including New York, California, Texas, and Virginia, have figures above the national average of 0.64 percent of total occupied households lacking adequate plumbing. Alaska has the highest: 6.32 percent, or 14,003 households, lacking complete plumbing facilities. Nebraska has the lowest: 0.36 percent, or 2,408 households. Calculations for numbers of people show that California has the largest number, with more than 240,000 people (or 85,460 occupied households) lacking complete plumbing. Wyoming has the least, with about 2,500 people (or 1,011 occupied households). The top 10 states with the highest numbers for households with inadequate plumbing (Table 9) hold more than half of such households in the United States. Within these states, the AIAN population has the highest level of inadequate plumbing – an average of 3.21 percent of AIAN households. Of these 10 states, 5 have had an average 25 percent increase in households lacking plumbing facilities, and the other 5 have had an average 24 percent decrease. These 10 states had an average overall increase of 16 percent in the number of total households lacking complete plumbing services from 1990 to 2000. There are myriad reasons why the percentages decreased in some states and increased in others. These include different levels of investment in water and sanitation infrastructure and access to safe drinking water and sanitation, in-migration of low-wage laborers, and existing employment and infrastructure base.

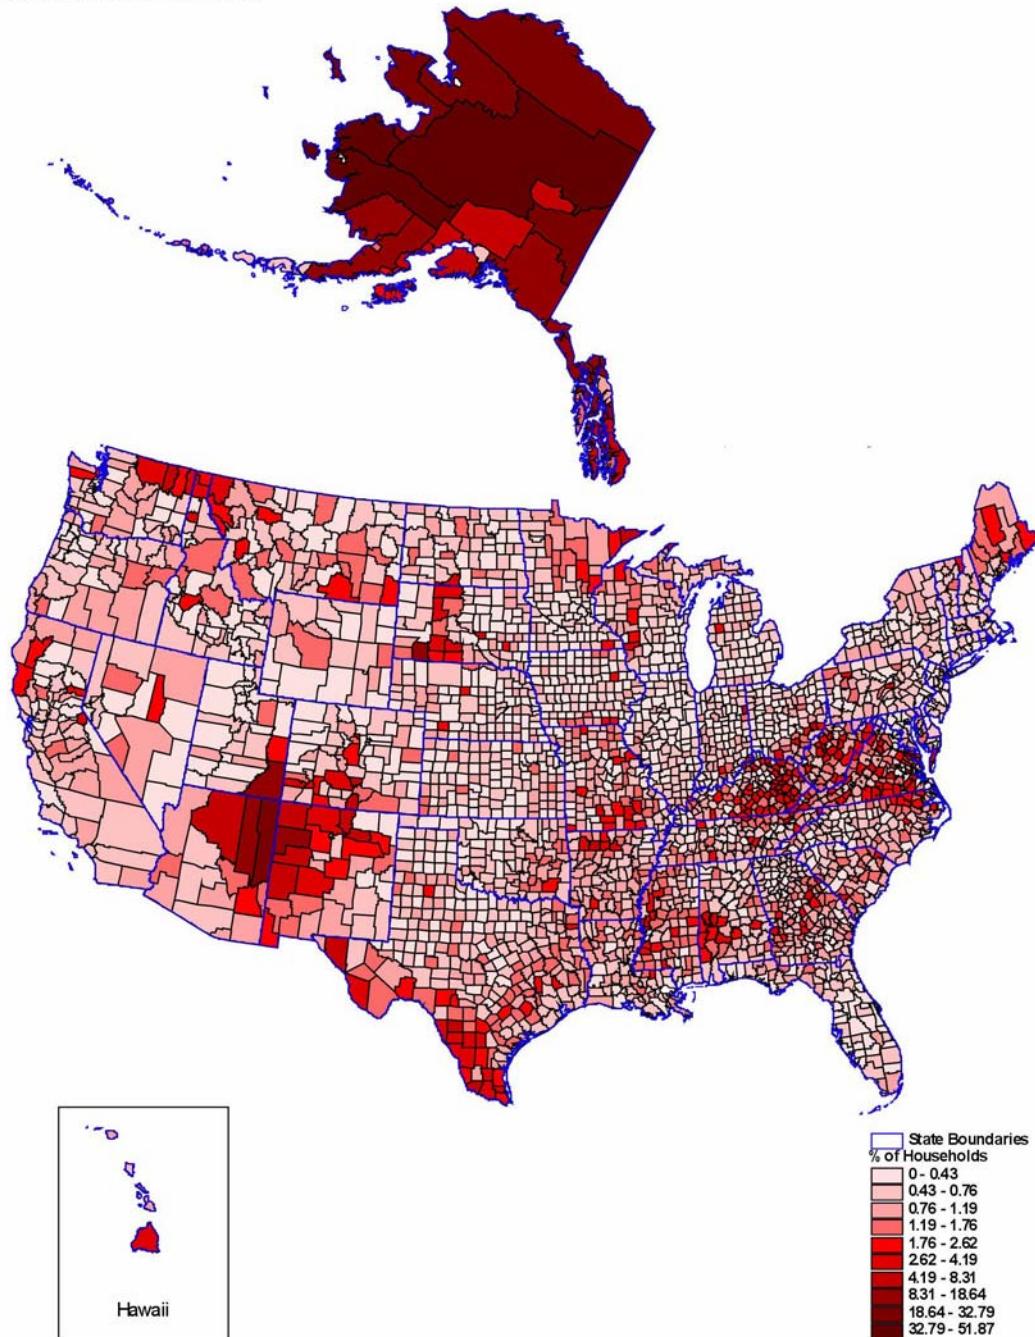

**Table 9. Total and Percentage of Occupied Housing Units Lacking Complete Plumbing Facilities, in Top 10 States Ranked for 2000**

U.S./State	Occupied Housing Units Lacking Complete Plumbing					Percentage Change From 1990 to 2000 in Total Households
	Total (2000)	Percentage (2000)	Total (1990)	Percentage (1990)	Percentage Change from 1990 to 2000	
United States	670,986	0.64	721,693	0.78	-7.03	14.72
California	85,460	0.74	57,974	0.56	47.41	10.8
New York	58,418	0.83	50,428	0.76	15.84	6.29
Texas	54,853	0.74	56,844	0.94	-3.5	21.78
Florida	30,134	0.48	22,061	0.43	36.59	23.43
Pennsylvania	24,450	0.51	26,355	0.59	-7.23	6.25
Illinois	23,959	0.52	21,572	0.51	11.07	9.27
Arizona	21,088	1.11	18,352	1.34	14.91	38.9
Virginia	19,550	0.72	35,788	1.56	-45.37	17.77
Ohio	19,407	0.44	24,394	0.60	-20.44	8.76
North Carolina	19,295	0.62	33,192	1.32	-41.87	24.43

### *County-Level Analysis*

As we took a closer look at the counties within the states (Map 7), we found several areas lacking in plumbing services that were not possible to identify at the state level. In terms of percentage of households lacking plumbing, the highest numbers showed up in the colonias along the Texas and New Mexico borders with Mexico; in several counties in West Virginia, Kentucky, Maryland, Virginia, North and South Carolina, Georgia, and Alabama; along the Washington border with Canada; in South Dakota and the predominantly Indian counties in Oklahoma; and around the Four Corners region in Arizona, New Mexico, Colorado and Utah. Almost all of Alaskan boroughs and census areas and the great majority of the municipios in Puerto Rico have higher percentages of households lacking plumbing than show up in any other regions. Interestingly, 16 of the 20 counties

**Map 7. US: Percent of Total Occupied Housing Units Lacking Complete Plumbing Facilities in Counties**

in the United States (including Puerto Rico here) with the highest percentages of households lacking plumbing facilities – ranging from 10.66 percent in Alta Vega municipio in Puerto Rico to 51.87 percent in Wade Hampton census area in Alaska – are in Alaska and Puerto Rico. Of the remaining four, three are in the Four Corners region, and one is in South Dakota.

If we look at the population figures, we see that Apache and Navajo counties in northeastern Arizona, the colonias in southern Texas, and several highly urban counties in California, Texas, New York, Michigan, Illinois, Pennsylvania, and Florida show some of the largest populations with inadequate plumbing. Together, the top 20 counties with the highest figures for population lacking complete plumbing hold more than a quarter of the total estimated U.S. population lacking proper plumbing services.

#### *Rural-Urban Analysis*

The rural-urban analysis for the states shows that the states with the highest percentage of rural and rural-farm homes lacking proper plumbing are fairly similar across both areas (Table 10), with the exception of Pennsylvania, which has a higher percentage of its farm households with plumbing. Alaska stands out as the state with the highest percentages across all the three areas – urban, rural, and rural-farm. Most of the affected urban areas are in densely populated cities on the coasts or rivers in the South, Southwest, Northeast, and Hawaii.

**Table 10. Percentage of Rural, Rural-Farm, and Urban Occupied Housing Units Lacking Complete Plumbing Facilities, in Top 10 States, Ranked for 2000**

Rank	Occupied Housing Units Lacking Complete Plumbing Facilities					
	Rural		Rural-Farm		Urban	
	State	%	State	%	State	%
1	Alaska	16.89	Alaska	11.63	Alaska	1.04
2	Arizona	6.20	Hawaii	7.32	New York	0.86
3	New Mexico	5.73	Arizona	3.64	District of Columbia	0.85
4	Hawaii	4.55	Pennsylvania	2.75	California	0.73
5	Kentucky	1.71	West Virginia	2.51	Texas	0.65
6	Virginia	1.66	New Mexico	2.38	Massachusetts	0.64
7	West Virginia	1.55	Maine	2.38	Louisiana	0.60
8	Utah	1.43	Virginia	2.09	Hawaii	0.60
9	Maine	1.26	Wisconsin	1.89	Mississippi	0.56
10	Montana	1.18	Kentucky	1.85	Rhode Island	0.56

Rural households in the United States total 226,967, and more than 600,000 people live in homes that lack adequate plumbing. Another 6,868 rural households, or more than 23,000 people, in Puerto Rico and the Island Areas live in similar or worse conditions. The 10 states with the highest populations lacking plumbing in rural-farm and urban areas are shown in Table 11.

**Table 11. Estimated Rural, Rural-Farm, and Urban Population Lacking Complete Plumbing Facilities, in Top 10 States, Ranked for 2000**

Rank	Estimated Population Lacking Complete Plumbing Facilities					
	Rural		Rural-Farm		Urban	
	State	Pop.	State	Pop.	State	Pop.
1	Texas	41,411	Wisconsin	2,588	California	226,584
2	Arizona	36,529	Ohio	2,442	New York	137,966
3	Alaska	35,392	Kentucky	2,383	Texas	109,131
4	Virginia	30,926	Pennsylvania	2,349	Florida	66,143
5	Kentucky	30,230	Missouri	2,031	Illinois	56,243
6	North Carolina	27,044	Texas	1,840	New Jersey	42,832
7	New Mexico	25,648	Indiana	1,805	Pennsylvania	39,701
8	Pennsylvania	21,416	Minnesota	1,362	Massachusetts	36,048
9	Tennessee	21,213	Virginia	1,331	Michigan	30,973
10	Ohio	20,079	Iowa	1,315	Ohio	29,166

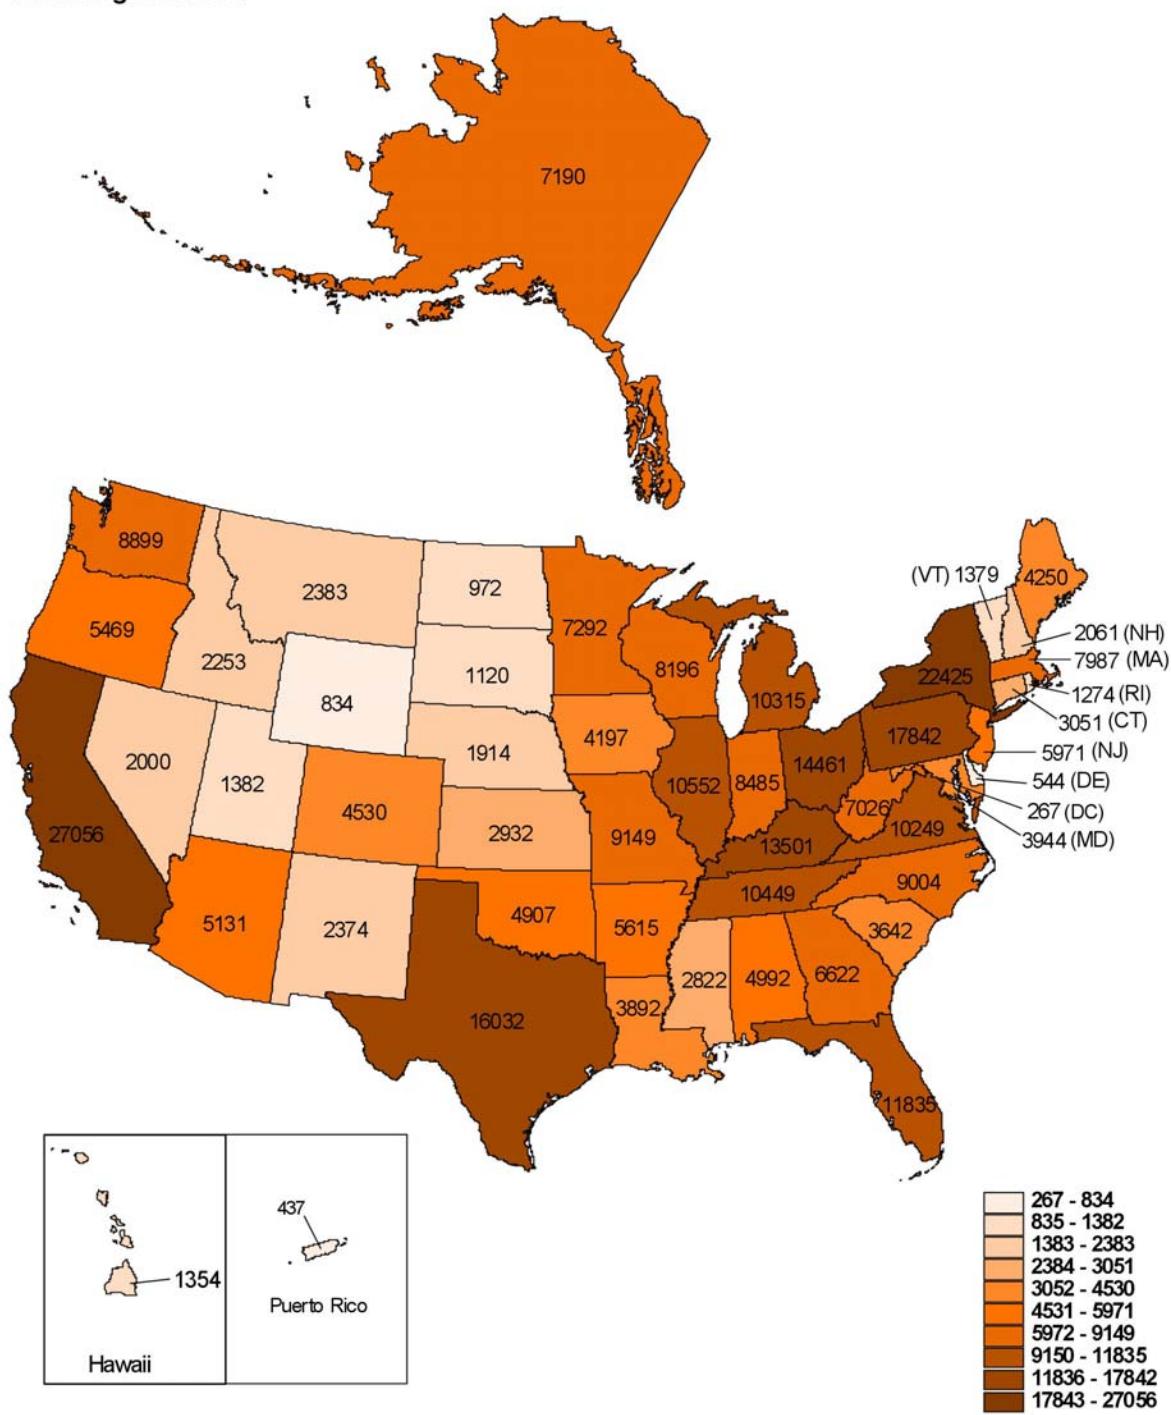

In the top 10 rural states shown in Table 11, plumbing is lacking in 1.5 percent of the rural households. This number is almost 1.5 times the national rural average and 3 times the national urban average. In the case of rural-farm populations in the top 10 states shown in Table 11, a rural-farm resident is almost three times as likely as an average urban American to lack complete plumbing facilities.

In general, rural residents are 2 times and rural-farm residents are 2.5 times more likely to lack plumbing than their urban counterparts.

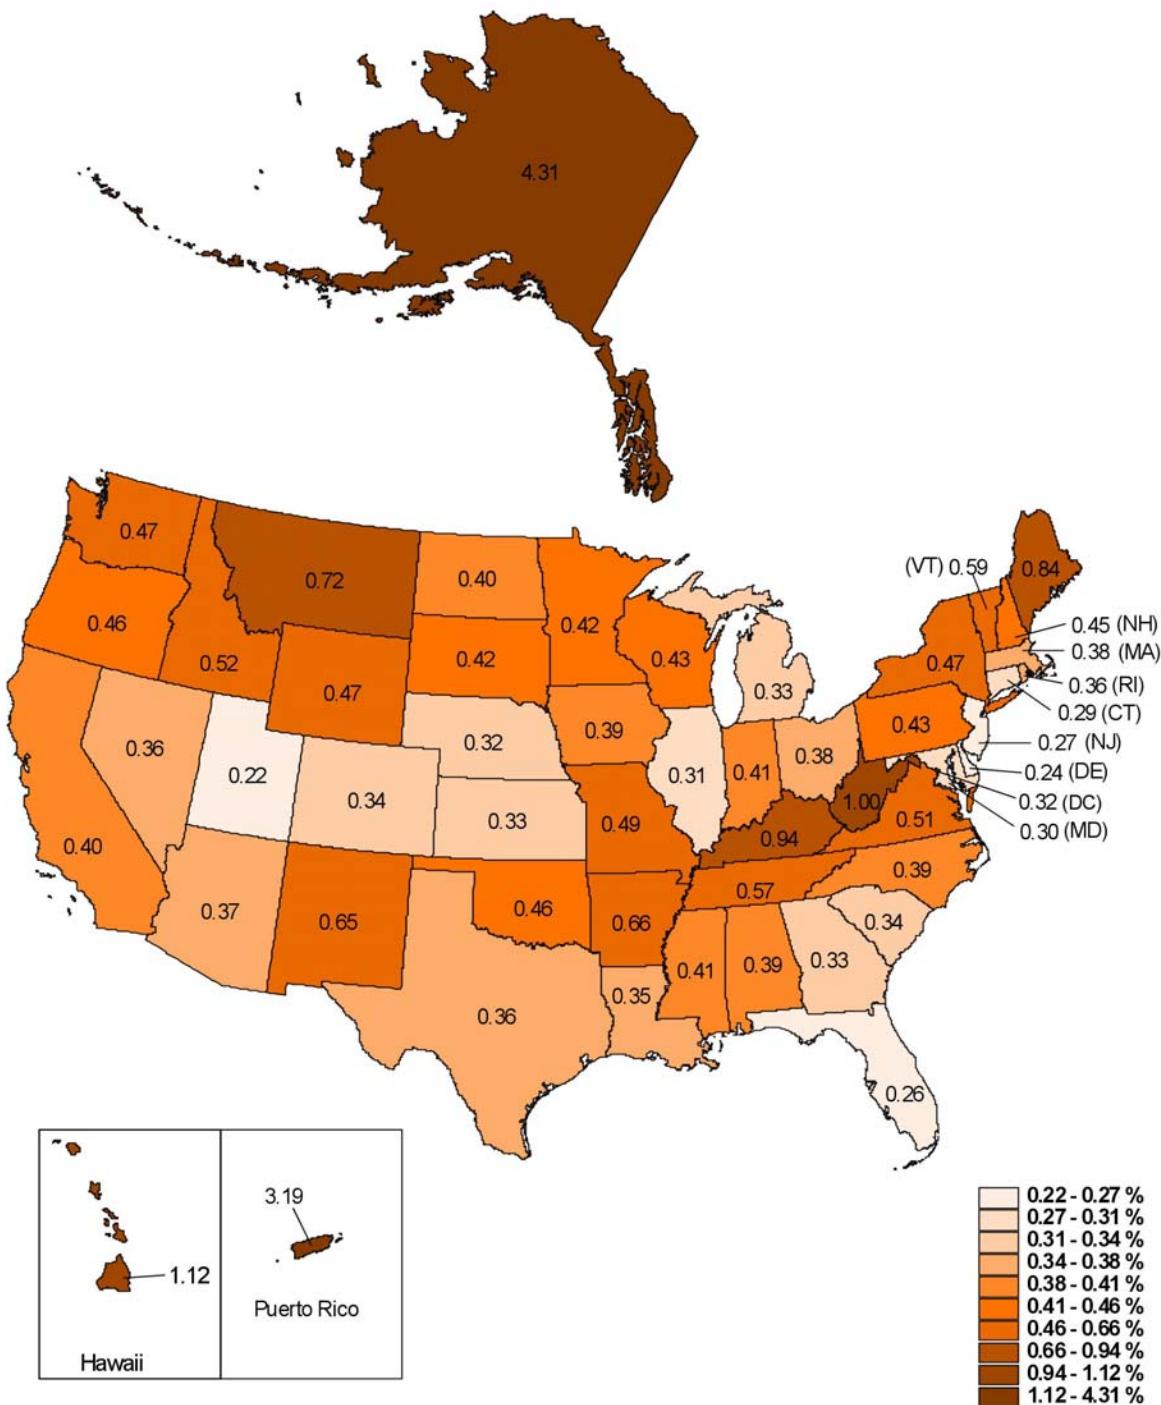

#### *Ethnic Distribution*

In terms of ethnic distribution, Whites have higher percentages of households without adequate plumbing in the socioeconomically marginalized areas in West Virginia, Kentucky, Montana, Alaska, and Maine (Maps 8 and 9), and Blacks have higher percentages in Virginia, New York, Louisiana, Alabama, North and South Carolina, Oregon and Montana (Maps 10 and 11). Hispanic households that are affected have higher percentages in most of the New England states and in the states with larger Latino or Spanish-speaking populations – California, Texas, and New Mexico. The most affected AIAN communities are concentrated in the Four Corners region and in Alaska.

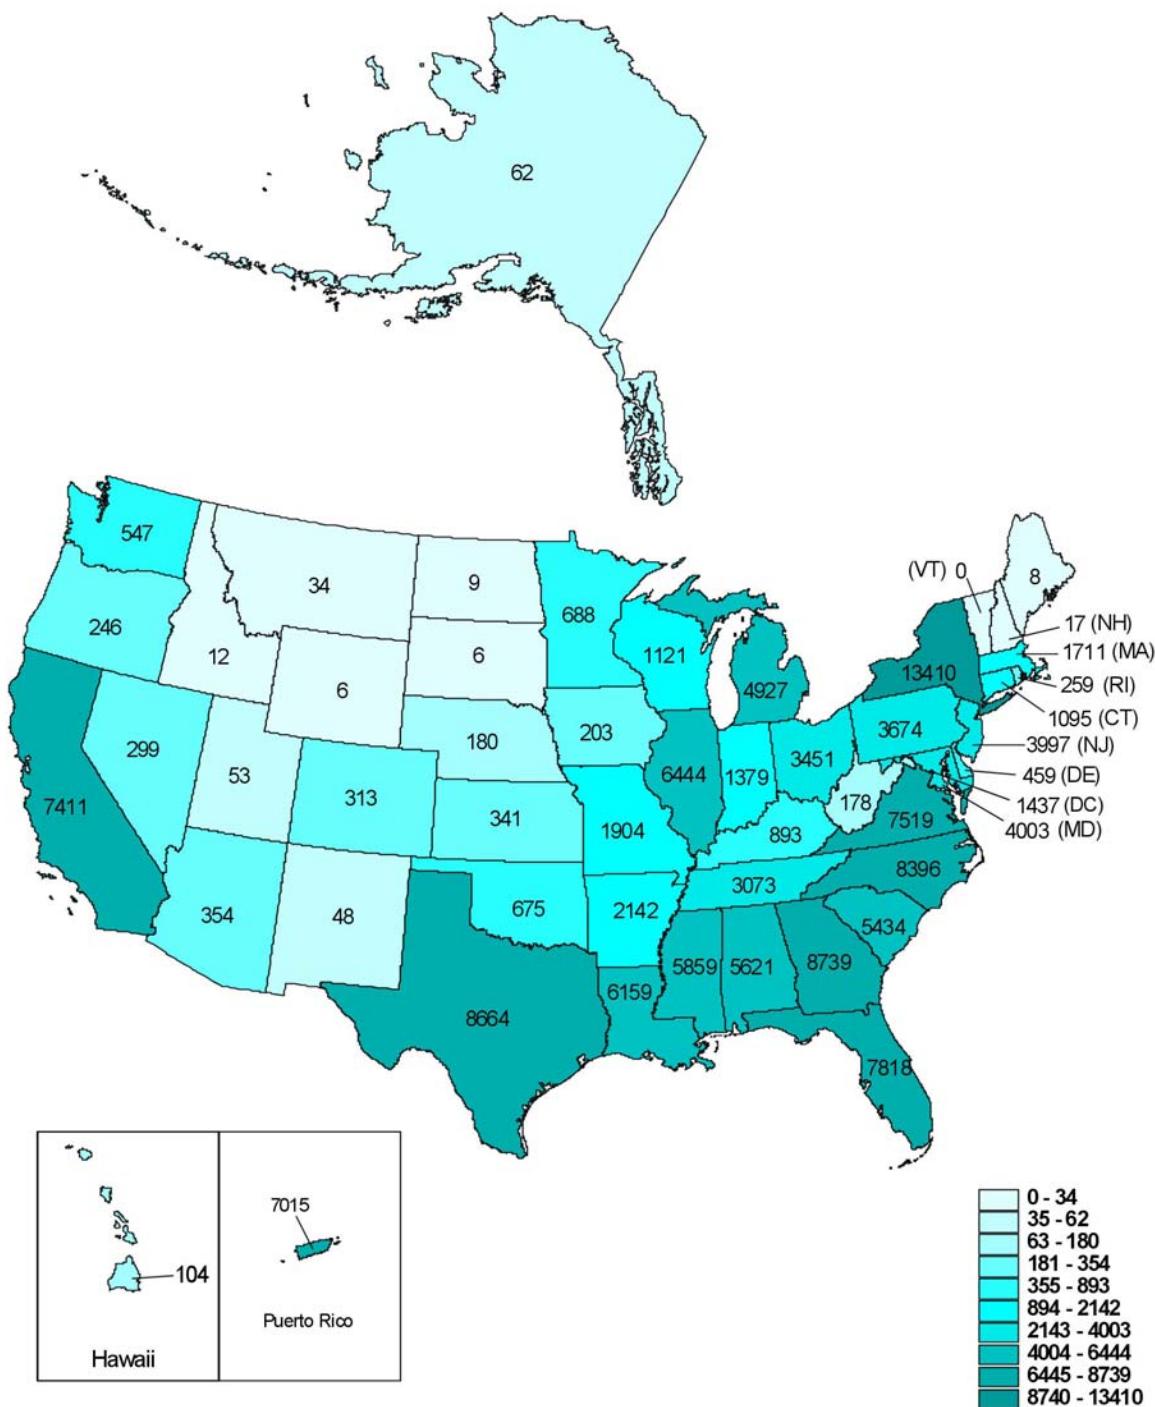

**Map 8. US: Total White (not Hispanic) Occupied Housing Units Lacking Complete Plumbing Facilities**

## Why Are Water and Sanitation Services Important?

Several studies have documented the critical importance of water and sanitation systems. A 1996 study by the University of Texas System's Texas-Mexico Border Health Coordination Office found that diseases such as hepatitis A, salmonellosis, shigellosis, and tuberculosis occurred at a much higher rate in the colonias than in the rest of the state.<sup>31</sup> The rate of reported hepatitis A, for example, was more than double the statewide rate. Other health problems included high rates of gastroenteritis and problems related to water quality. Medical services are rarely available, which compounds health problems in the colonias. For children, these problems result in slower growth and lower educational development rates.

Improved availability of water and sanitation has been among the greatest contributors to improved public health in industrialized countries. The eradication of the diseases mentioned above came about because of the implementation of basic sanitation and piped water systems in urban and rural areas. When these services are lacking, public health suffers, and with it economic growth, because ill people are inefficient students, workers, and contributors to society. It is for this reason that industrialized nations spent billions of dollars on water and sanitation during the development initiatives of the 1950s, 1960s, and 1970s. Still, as is evidenced in this report, there are groups of people who have not received the benefits of these initiatives. Clearly, one of the key steps to eliminating persistent poverty in these areas will be improved water services. Figure 1 demonstrates the impacts that investments in water and sanitation infrastructure can have on health.<sup>32</sup> Those nations with a higher percentage of the population served by safe drinking water have fewer deaths of children under the age of five. Egypt, Pakistan, and Sudan were significant outliers in the trends. Their situation might be explained by their substantial problems of political violence and chronic problems with developing effective mother-child health campaigns during the 1990s.

**Figure 1: Relationship Between Access to Safe Drinking Water and Child Mortality**

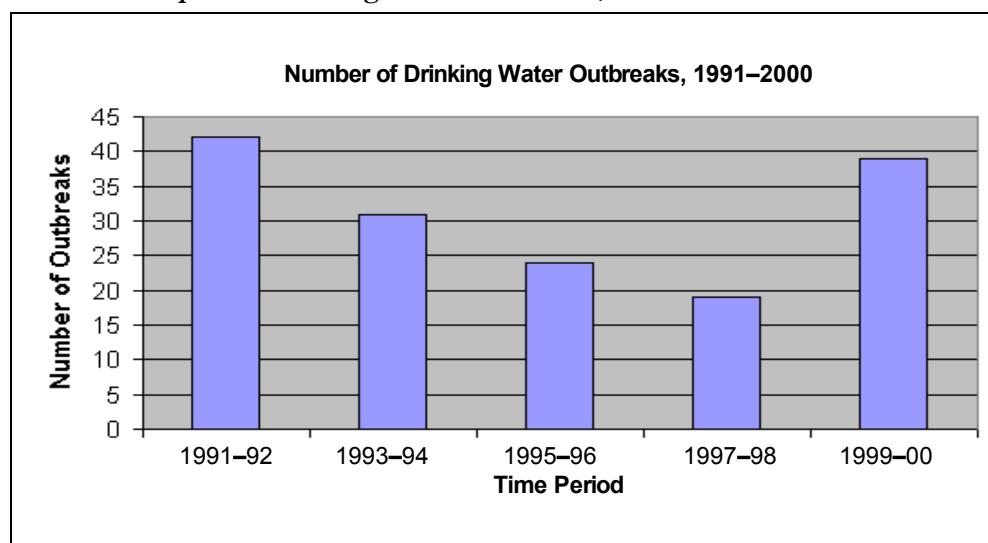

<sup>31</sup> Cited in Border Environment Research Reports (July 1996), *Improving the Quality of Drinking Water in Colonias in the Ciudad Juárez–El Paso Area*, Institute for Regional Studies of the Californias, San Diego State University, San Diego, California, <http://www.scerp.org/scerp/docs/berr3.html>.

<sup>32</sup> UNICEF, *State of the World's Children 2000*, United Nations, UNICEF, New York, New York, <http://www.unicef.org>, accessed May 2, 2004.

Typhoid, cholera, hepatitis A, and various other gastrointestinal maladies associated with waterborne disease were common in U.S. cities and rural areas through the early 1900s. As municipalities seized control of urban water systems, public health steadily improved in these areas through the first part of the 20th century.<sup>33</sup> It improved in rural areas with a steady increase in water and sanitation infrastructure investment, starting in the 1930s, accelerating in the 1950s, and further increasing substantially in the 1960s and 1970s, when government invested in basic services as part of President Lyndon Johnson's Great Society initiatives.<sup>34</sup> Since 1970, the number of people living without access to basic services and the number of waterborne disease outbreaks in rural America have steadily declined, as investments in both infrastructure and technical assistance to help rural areas develop water infrastructure have combined with the development of national regulations to protect groundwater and drinking water under the Safe Drinking Water Act (SDWA) of 1973. This act was strengthened in 1986 and amended in 1996 to provide both an ongoing process for assessing risk to drinking water systems and processes for stakeholders to assess the feasibility of implementing new safety rules.

It is important to recognize a major concern for those working to provide water and sanitation infrastructure: *While water infrastructure may be in place in many parts of the country, people may not be drinking safe water.* In 1999–2000, for instance, the Centers for Disease Control and Prevention reported 39 outbreaks of waterborne disease in 23 states, affecting 2,098 people. This was the highest number of reported outbreaks since 1991–1992. The number of cases, however, should be distinguished from their seriousness. While there were only 32 outbreaks of waterborne disease in 1993–1994 (Figure 2), more than 400,000 people in Milwaukee, for instance, were affected by *Cryptosporidiosis*, the diarrheal disease caused by a microscopic parasite *Cryptosporidium parvum*.<sup>35</sup>

In addition, USEPA reports that 91 percent of the total U.S. population is drinking water that meets established health and safety standards for maximum contaminant levels. This percentage varies for USEPA regions. It is 62 percent in the northeastern states (EPA Region 1: Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, Vermont); 76 percent in the Mid-Atlantic states and territories (EPA Region 2: New Jersey, New York, Puerto Rico, Virgin Islands); 83 percent for EPA Region 10 (Alaska, Idaho, Oregon, Washington); and over 90 percent for all other regions. U.S. Geological Survey samples of drinking water from 12 water supply systems from 1999 to 2001 found atrazine and simazine in 85 percent of all raw and finished water samples and triazine-herbicide degradation in 60 percent of raw and finished water samples.<sup>36</sup> Volatile organic compounds such as methyl teri-butyl ether have been found in 9 percent of community water systems (at higher concentrations in systems serving urban rather than rural areas).<sup>37</sup> All these compounds have impacts on human health if continuously ingested in large enough quantities over time.

While drinking water is relatively safe in the United States, the number of threats to its quality is never-ending. Increasingly, one hears stories of communities once dependent on private wells that have had to move to a centralized supply because of pollution of well supplies or diminishing supplies caused by development or other pressures. The number is even greater for community wastewater issues. In response to the 2000 Census, the residents in these communities are likely to have answered that they had complete plumbing facilities. In considering the challenge of serving those who still do not have access to basic services, it will be important to remember those communities that may have to be transformed from having individual wells to community water and wastewater systems in order to protect public health and the environment. The cost to the communities is likely to be just as great, if not greater. And in many of these communities, income levels are not likely to be high enough to support the investment in infrastructure without assistance.

## Factors Affecting People Living Without Basic Services

So how, in the richest nation on earth, do whole populations find themselves still living without plumbing facilities?

### *Socioeconomic Conditions*

For some populations that lack service, such as Alaska Natives, it is difficult to install and maintain water infrastructure because of distance and climatic conditions. Sociocultural and economic factors also are critical. Some Alaska Native villages, suffering from high unemployment and poverty, are reluctant to put in conventional water and sanitation systems because the cost of installing and maintaining systems in that environment would be unacceptably high. These factors explain, in part, Alaska's ranking as the state with the highest percentage of its population living with inadequate access to complete plumbing services. But a range of other issues at the local level also come into play, related to social organization and leadership, availability of technical expertise, and lack of access to funding to support water infrastructure development. These same conditions affect access to complete plumbing facilities in other parts of the United States where households still lack access to water and sanitation.

<sup>36</sup> U.S. Geological Survey, *Pesticides in Selected Water Supply Reservoirs and Finished Drinking Water*, 2001, <http://water.usgs.gov/nawqa/whatsnew.html>, accessed December 10, 2003.

<sup>37</sup> USGS, *MTBE and other Volatile Organic Compounds—New Findings and Implications on the Quality of Source Waters Used for Drinking Water Supplies*, Reston, Virginia, USGS, 2001, <http://water.usgs.gov/FS/fs10501/>, accessed December 10, 2003.

The relationship between poverty and inadequate plumbing is clear. Of the 670,986 households without access to complete plumbing facilities in the United States, one-third, or 222,906, had an income in 1999 that was below the federal poverty level. Roughly the same proportions applied in a rural-urban breakdown – 30.82 percent of all urban households lacking proper plumbing were poor, and 37.92 percent of rural homes lacking plumbing were poor (Table 12).

**Table 12. Percentage of Occupied Housing Units Lacking Complete Plumbing Facilities With Income in 1999 Below the Federal Poverty Level**

	<b>Occupied Housing Units Lacking Complete Plumbing Facilities</b>	
	<b>Total</b>	<b>% of Units With Income Below 1999 Poverty Level</b>
U.S. – Overall	670,986	33.22
U.S. – Urban	444,019	30.82
U.S. – Rural	226,967	37.92

Nationwide, 1.79 percent of all poor households lacked plumbing, as did 1.37 percent of all urban poor households and 3.52 percent of all rural poor households. Thus, a poor rural household is almost 2.5 times as likely as a poor urban household in the United States to lack proper plumbing.

Of all the states, Alaska had the highest proportion: 18.85 percent of all its homes that were poor also lacked proper plumbing. Kansas had the lowest proportion, at 0.83 percent. Taking into account only the homes that lacked plumbing facilities, New Mexico had the highest percentage that were also poor – 50.37 percent of its homes without plumbing were also below the federal poverty level (Table 13).

**Table 13. Percentage of Occupied Housing Units Lacking Complete Plumbing Facilities and With Income in 1999 Below the Poverty Level, Top 10 States**

<b>State</b>	<b>Occupied Housing Units Lacking Complete Plumbing Facilities</b>	
	<b>Total</b>	<b>% of Units With Income Below 1999 Poverty Level</b>
New Mexico	11,905	50.37
Arizona	21,088	47.60
West Virginia	7,451	46.84
Kentucky	14,947	46.58
Mississippi	9,015	46.00
Louisiana	10,717	42.10
Alabama	11,005	41.98
Texas	54,853	39.89
Arkansas	8,327	39.59
South Dakota	1,858	39.56

We also found that owner-occupied households below the poverty level were statistically more likely than renter-occupied households to lack access to complete plumbing facilities, probably because of regulations that require landlords to provide basic facilities. Of the owner-occupied households living in poverty, 2.02 percent, or 88,211 households, lacked complete plumbing facilities in 2000. Of the renter-occupied households below the poverty level, 1.67 percent, or 134,695 households, reported lacking these facilities (Table 14). While people living in poverty were almost 4 times more likely not to have complete plumbing facilities than those living above the poverty level, in pure numeric terms more households above the poverty level than below who lack complete water and sanitation. In some cases, the explanation may be that these people have chosen to live in isolation.

Or, because of high home prices on the coasts, even people with incomes above the poverty level may live in substandard housing.

Table 14 also shows that households above the poverty level were statistically less likely to have incomplete plumbing facilities than households below the poverty level. Only 0.37 percent of owner-occupied houses above the poverty level and 0.75 percent of renter-occupied houses above the poverty level lacked complete facilities. The percentages demonstrate that income is a significant variable in whether people have complete plumbing services. But the fact that the majority of people living without complete water and sanitation facilities were not below the poverty level in 2000 indicates the importance of recognizing the geographic and social aspects of water services. Even relatively wealthy people may lack certain services because they live in larger communities that lack services.

**Table 14. Plumbing Facilities by Household Type, 2000**

Households	Total	Percentage
<b>Total</b>	<b>105,480,101</b>	
<b>Owner-occupied</b>	<b>69,816,513</b>	
Income in 1999 below poverty level	4,371,712	
Complete plumbing facilities	4,283,501	
Lacking complete plumbing facilities	88,211	2.02%
Income in 1999 at or above poverty level	65,444,801	
Complete plumbing facilities	65,204,152	
Lacking complete plumbing facilities	240,649	0.37%
<b>Renter-occupied</b>	<b>35,663,588</b>	
Income in 1999 below poverty level	8,086,254	
Complete plumbing facilities	7,951,559	
Lacking complete plumbing facilities	134,695	1.67%
Income in 1999 at or above poverty level	27,577,334	
Complete plumbing facilities	27,369,903	
Lacking complete plumbing facilities	207,431	0.75%

#### Ruralness

A more significant finding is the relationship between ruralness and access to complete plumbing facilities. Rural households, as has been discussed above, are more likely than urban ones to lack access to complete plumbing facilities. Furthermore, all the counties where the percentage without complete plumbing facilities is particularly high are non-metro—such as Star County, Texas, and Navajo County, Arizona. As Table 1 showed, this has been the case for at least the past 50 years. By their very nature, rural communities are hard to reach with basic services. They are also less likely to have the human, financial, and built capital (e.g., buildings, facilities, plants) necessary for the implementation of improved water systems. Equally important is the relationship among ruralness, lack of proper plumbing, and level of poverty. As Table 15 shows, the more desolate (less populated) the rural area, the more likely it is that a household that lacks proper plumbing is also poor, by as much as 39 percent.

**Table 15. Percentage of Rural Occupied Housing Units Lacking Complete Plumbing Facilities With Income Below Poverty Level in 1999**

Rural Level	Occupied Housing Units Lacking Complete Plumbing	
	Total	Percentage With Income in 1999 Below Poverty Level
U.S. – Rural	226,967	37.92
U.S. – Rural – in a place	41,704	35.40
Rural – in a place of 2,500 or more people	9,156	29.51
Rural – in a place of 1,000 to 2,500 people	13,288	37.45
Rural – in a place of fewer than 1,000 people	19,260	36.80
Rural – not in a place	185,263	38.49

Nationally, rural communities are also more likely to be in violation of SDWA health and safety regulations. The SDWIS 2003 Factoids demonstrate that smaller water systems are significantly more likely to be in violation of health and safety standards. In keeping with that finding, this analysis demonstrates that systems in violation of SDWA standards tend to be in counties where more people lack complete plumbing facilities.

#### *Cost and Quality of Water and Sanitation Services*

An additional issue of concern is the quality of the water people are drinking. While we did not have access to specific water quality data by locality for analysis in this report, USEPA databases on drinking source water quality indicate that 10 percent of surface-based source water did not meet USEPA clean water and safe drinking water standards.<sup>38</sup> In addition, SDWIS indicates that 8.2 percent of very small to medium-size community water systems that meet the needs of populations below 10,000 had health safety violations in 2003; these situations affected a total of 4,242,015 people.<sup>39</sup>

Because rural areas have fewer people to pay the cost of providing services, the cost of water service is higher overall in rural than in urban areas.<sup>40</sup> We used statistical tools to analyze the cost of water service in areas where a relatively high percentage of the population reported lacking plumbing services and found a weak relationship between the cost of water services and rural households without plumbing ( $R^2$  of 0.018). Nonetheless, this relationship was significant (0.000 level). Additional analysis shows that the cost of water services is rising at a higher rate than inflation, especially in rural areas. Many observers are concerned that replacements or upgrades of obsolete water systems in much of America, combined with the costs of complying with safe drinking water standards, are likely to raise the cost of water infrastructure even more in the near future. While the overall percentage of household income going to pay for water and sanitation services in the United States is among the lowest in the world, there is a danger that certain portions of the population may

<sup>38</sup> USEPA, Office of Watersheds, Oceans and Wetlands, Index of Watershed Indicators, 2004, <http://www.epa.gov/iwi/>; [http://www.epa.gov/safewater/data/pdfs/factoids\\_2003.pdf](http://www.epa.gov/safewater/data/pdfs/factoids_2003.pdf); <http://www.epa.gov/safewater/data/pivotables.html>, accessed May 25, 2004. There were 49,497 very small, small, and medium-size community water systems in the United States, of which 4,057 had health safety violations in 2003.

<sup>39</sup> USEPA Office of Groundwater and Drinking Water, Safe Drinking Water Information System (SDWIS), 2004, <http://www.epa.gov/safewater/sdwis/>, accessed May 2, 2004.

find themselves unable to afford water services without sacrificing other basic needs, even though water services may be available.<sup>41</sup>

### *Demographics*

Our analysis shows that the breakdown by age of the people lacking water and sanitation services more or less mirrors the age distribution for the general population. The elderly (age 65 years and older) make up just over 10 percent of the people who lack plumbing services (Table 16). People younger than 15 constitute just over 32 percent of the total population that lacks plumbing facilities. The elderly and children are most at risk from the consequences of waterborne disease. For this reason, it will be important to continue to track the access to services as well as the quality of water and sanitation services specifically for these age groups.

**Table 16. Population in Occupied Housing Units Lacking Complete Plumbing Facilities, by Age Group, 2000**

	Population in Occupied Housing Units Lacking Complete Plumbing Facilities							
	Below 5 years		Below 15 years		Above 15 and below 65 years		65 years and above	
	Total	Percentage	Total	Percentage	Total	Percentage	Total	Percentage
U.S.	143,117	8.01	443,291	24.80	1,019,009	57.01	181,897	10.18

## Factors Influencing Trends in Access to Water and Sanitation

### *Socioeconomic Immigration*

As documented above, people living without access to plumbing services are not evenly distributed across ethnic groups or across geographic areas. American Indians and Alaska Natives, Hispanics, and African Americans all disproportionately lack access to services. Similarly, the populations living with inadequate access to services are highest in four regions—the Four Corners region of the Southwest; the Black Belt across the southern United States; California; and the Mexican border regions of Texas, New Mexico, and Arizona.

Of these four regions, California is the most striking because in this area the population that reported lacking services actually increased between 1990 and 2000. At first glance, this increase appears strange because during most of that decade California's economy boomed, led by the dot-com boom in Silicon Valley. We hypothesize that two factors contributed to the rise of populations in California living without access to water services. First, the boom of the 1990s led to an increase in housing prices that far outstripped inflation and earning power for many people in California. This situation was exacerbated when the economy began a downturn at the end of the decade. As the economy soured, a relatively high number of people found themselves either homeless or living in substandard housing. The socioeconomic conditions between 1995 and 2000, for example, led 345,573 Hispanics to leave California for nearby states.<sup>42</sup> Second, the boom did open up high numbers of very low-paying service jobs, which attracted immigrant labor. We suspect that most of the immigrants came from Central and South America, where weakened economies made the agricultural and service sector jobs in California seem an attractive economic opportunity. This

<sup>41</sup> Ibid.

<sup>42</sup> The net out-migration in this period was 345,573. Actually, 505,947 Hispanics left California but 160,374 Hispanics in-migrated from other states into California during the same period. See <http://www.census.gov/population/www/cen2000/phc-t25.html>, accessed May 19, 2004.

relative prosperity, though, did not provide these immigrants with adequate remuneration to pay for housing with improved services, especially in California's inflated housing market.

The Census records show that a total of 660,076 Hispanic immigrants moved to California during the latter half of the 1990s.<sup>43</sup> The large majority of these immigrants presumably worked in low-paying service sector positions. Of a total of 5,781,105 Hispanic workers above the age of 16 in California in 2000, more than 41 percent were employed in medium-, low- and very low-paying jobs or were unemployed (Table 17).<sup>44</sup> In addition, 19.55 percent of the Hispanic population in California between the ages of 18 and 64 years were below the poverty level in 1999.<sup>45</sup>

**Table 17. Number of Hispanics Employed by Occupation in California, 2000**

Occupation	Employed
Cooks and food preparation workers; waiters and waitresses	257,683
Other food preparation and serving workers, including supervisors	100,843
Building and grounds cleaning and maintenance occupations	486,966
Secretaries and administrative assistants	92,185
Agricultural workers, including supervisors	283,245
Carpenters, painters, paperhangers, woodworkers, metal and plastic workers	266,255
Construction laborers; other construction workers and helpers	140,504
Food-processing workers	40,393
Textile, apparel, and furnishings workers	146,848
Bus drivers; driver/sales workers and truck drivers	184,004
Motor vehicle operators, except bus and truck drivers	9,374
Laborers and material movers, hand; other material moving workers, except laborers	291,749
Unemployed, with no work experience since 1995	80,340
Total	2,380,389

Tulare County, California, the poorest county in California, is an example. Tulare County is largely agricultural and employs a high number of people as agricultural laborers. According to the Census, more than 1,500 people in this county live without access to complete plumbing services. Onsite observation by Public Citizen, a national nonprofit organization, revealed "communities without running water, many issues of contaminated water from the fertilizers and pesticides used in farming, and communities that buy their water from tanker trucks for 25 cents a gallon."<sup>46</sup>

### *Housing Development*

In contrast, the decrease in the numbers of people living without access to basic services in Alabama, Louisiana, and Mississippi may be attributable to marginally better economic conditions. With the improved economy, people began to move out of substandard housing units into manufactured housing units, which often come with piped water units included. The number of people living in mobile homes from 1990 to 2000 increased, on average in the three states, by 38.38 percent (Table 18). A critical issue of concern is that community or noncommunity water systems that serve mobile home communities are more prone than other water systems to be in violation of state and federal standards for health and the environment. Thus, while people may have access to piped water, the water they are drinking may not be up to standards.

<sup>43</sup> U.S. Census 2000, Migration by Race and Hispanic Origin for the Population 5 Years and Over for the United States, Regions, States, and Puerto Rico: 2000, <http://www.census.gov/population/www/cen2000/phc-t25.html>, accessed May 19, 2004.

**Table 18. Mobile Occupied Housing Units in Alabama, Louisiana, and Mississippi, 1990–2000**

State	Mobile Occupied Housing Units		
	2000	1990	% Change from 1990
Alabama	269,000	187,613	43.38
Louisiana	204,912	161,751	26.68
Mississippi	168,520	114,900	46.67

Clearly, these are associations, as opposed to verifiable relationships. But they do provide an insight into some of the hypotheses that will need to be developed and tested as we try to understand further the relationships that contribute to the access to or loss of water and sanitation service.

### What Has Been and Is Being Done to Address These Issues?

The progress made since the 1950s has been the result of synergy among government investments, community initiatives, and the assistance provided by several nongovernmental organizations. The federal government has developed nationwide programs such as the Clean Water and Safe Drinking Water State Revolving Funds to capitalize improvements in access to and quality of water and sanitation services. The U.S. Department of Agriculture's Rural Utilities Service provides a combination of loans and grants to rural communities for the same purpose. In addition, federal funds are available for infrastructure, including Community Development Block Grants and grants from agencies such as the Indian Health Service – the latter obviously targeted toward American Indians and Alaska Natives.

In addition, the federal government now funds an infrastructure of technical assistance programs designed to aid communities in improving access to water and sanitation services, such as the Rural Community Assistance Partnership, the National Rural Water Association, and the Environmental Finance Centers. The USEPA also funds applied research and demonstration programs such as the National Drinking Water Clearinghouse and the Technical Assistance Centers.

While this institutional infrastructure has made a significant difference in providing water and sanitation services over the past 30 years, it is important that these institutions are maintained for the future. The challenges facing water systems are increasing rather than decreasing.

### Ensuring That Water Infrastructure Is Adequately Maintained

While a greater proportion of the U.S. population than ever before has access to water and sanitation services, new threats are emerging to those services, as follows:

- New immigrant laborer populations are moving in to work as farm laborers or in other low-paid sectors. These populations may live in substandard conditions, lacking basic services. This risk is high if workers continue to come into the country as undocumented workers, especially in rural areas, leaving them open to exploitation by their employers.
- Water infrastructure in the United States was installed over three development waves: the early 1900s, the 1930s, and the 1950s–1970s. Because of the lifespan of the materials used during each of these building eras, infrastructure replacement for all three is likely to be needed in the next 20 years. This will be tremendously costly, at a time when government resources are scarcer than in the past. If local communities are expected to shoulder the cost of replacement themselves, especially in rural areas, concerns about maintaining basic infrastructure will increase.
- New environmental conditions and elements threaten our water supply. As regulations are developed to try to address these threats, the costs of treatment are likely to rise. Treatment

costs will be especially problematic for rural community water systems, because they are not likely to have economies of scale to help them afford the treatment technology.

Even as the United States continues to provide some of the best and least costly access to basic services in the world, new challenges are threatening those services. The combination of aging infrastructure, new population distribution, and growing demands creates complex challenges to overcome for ensuring that people have access to services. Indeed, in a time when both federal and state governments claim record deficits and are cutting popular programs, communities are facing expensive new demands for water and sanitation services. Many small, low-income communities are looking at costs in the hundreds of thousands or even millions of dollars to repair, upgrade, or expand water systems to meet new needs.

For example, a study by the West Central Initiative in Minnesota found that in the west central counties of Minnesota – where the percentages of people without plumbing service are lower than the national average – communities were increasingly faced with the challenge of repairing or replacing aging infrastructure. The study found that these communities faced a funding gap of \$813 million to upgrade infrastructure systems, many of which were initially installed in the 1930s.<sup>47</sup>

Donaldson, Minnesota, is one of those communities. With a population of only 57, a median household income of \$15,938 in 1999, and an annual city operating budget of less than \$15,000, the city was dumbfounded by the need to eliminate two serious public health hazards: untreated sewage that was being discharged into a road ditch, and a half-dozen rundown housing structures that were homes to vermin. The municipal storm water system, built in 1936, discharged into a highway ditch west of town. Septic systems installed for indoor plumbing in the 1950s and 1960s let the effluent discharge directly into the city storm water system. A high water table and tight clay soils made drainfields very expensive, and they typically performed poorly. Although this type of system was effective in getting the wastewater out of town, the untreated sewage draining down the highway ditch created a public health violation. In addition to the costs of constructing a new wastewater system, the city faced penalties and fines from the Minnesota Pollution Control Agency. The city council also identified six properties that were in severe stages of neglect. Some had basements that had six to eight feet of stagnant water, and others had dead animal carcasses and feces. All housed some type of vermin. The structures had broken glass doors and windows, making it very easy for children to gain access to the dangerous environment. Forcing the homeowners to clean up the properties was not an option because the costs were insurmountable.

With the help of intermediaries to provide technical assistance, Donaldson has been able to contract with an engineering firm to develop a solution that fits within the financial constraints of the community. It also was able to secure a combination of loans and grants from state and federal agencies, and it worked out a way to lower costs by doing some of the work itself, using local labor and resources.<sup>48</sup>

While this case is taken from Minnesota, communities throughout the country are grappling with similar issues. The critical point is that many communities will have to deal with such issues in the future, even though the vast majority of U.S. residents have access to water and sanitation services.

## Key Program and Policy Concerns Related to These Issues

We think of water and sanitation as a given in the United States. Yet the building and maintenance of the infrastructure systems that make these resources available to us involve expensive technologies and engineering expertise. More important are the resources that are managed through social and institutional relationships.

USEPA estimates the shortfall in resources for infrastructure in the United States at between \$200 billion and \$500 billion over the next 20 years. Government resources will be critically important in addressing this gap in funding. But government resources will also need to leverage private and nonprofit resources. Ultimately, it is the communities and the counties that will incur these costs.

It would be a mistake to assume that the money needed to resolve this issue should be restricted to resources for pipes and fittings. The provision and maintenance of water and sanitation over time involves building the civic and social infrastructure so that communities themselves have the capacity to make decisions about the scope and type of infrastructure that will ensure them water and sanitation that is safe and affordable. Peter Gleick of the Pacific Institute in California, for example, has been calling for more attention to the soft path (development of the social infrastructure) to ensure access to adequate water and sanitation all over the world, including the United States. He argues that advances in management and delivery of water resources of the last two centuries have come about largely through implementing hard systems, meaning technology and physical infrastructure that require high capital investment. Often these built and financial capital investments have been made without regard to local desires and needs and without attention to issues of representation and social justice.<sup>49</sup>

As a result, we have the community along Coal Run Road, outside Zanesville, Ohio, which was systematically denied water services until recently, even though it was located next to a significant urbanized area. The lack of water services had much more to do with social injustice than with technology and financing.<sup>50</sup> Similarly, the Environmental Finance Center at the University of North Carolina at Chapel Hill documented systematic lack of access to water services by African American neighborhoods in the middle of larger metropolitan North Carolina communities.<sup>51</sup>

Critically related to these concerns is the very serious concern about the quality of drinking water. As cited above, USEPA has found that significant portions of the population are subjected to water that does not meet standards of safety and quality. A good portion of community water system violations of SDWA standards are actually administrative in nature, indicating that management capacity is as critical as technology.

The infrastructure investments of the future must combine reinvestment in physical infrastructure with investment in a civic infrastructure. This civic infrastructure must involve improved training of local water operators and water boards and investment of the time and effort to build participatory networks that can create local support for water system maintenance and source water protection. It may involve acceptance of alternative technologies that deliver safe drinking water at lower cost. The soft path should provide opportunities for continual improvement in access to water and sanitation through building human and social capacity.

As a society, we have made substantial progress since the 1950s in providing our citizens with access to water and sanitation systems. In percentage terms, the number of people without services is small,

<sup>51</sup> Personal communication between the authors and the Environmental Finance Center, University of North Carolina at Chapel Hill, November 2003.

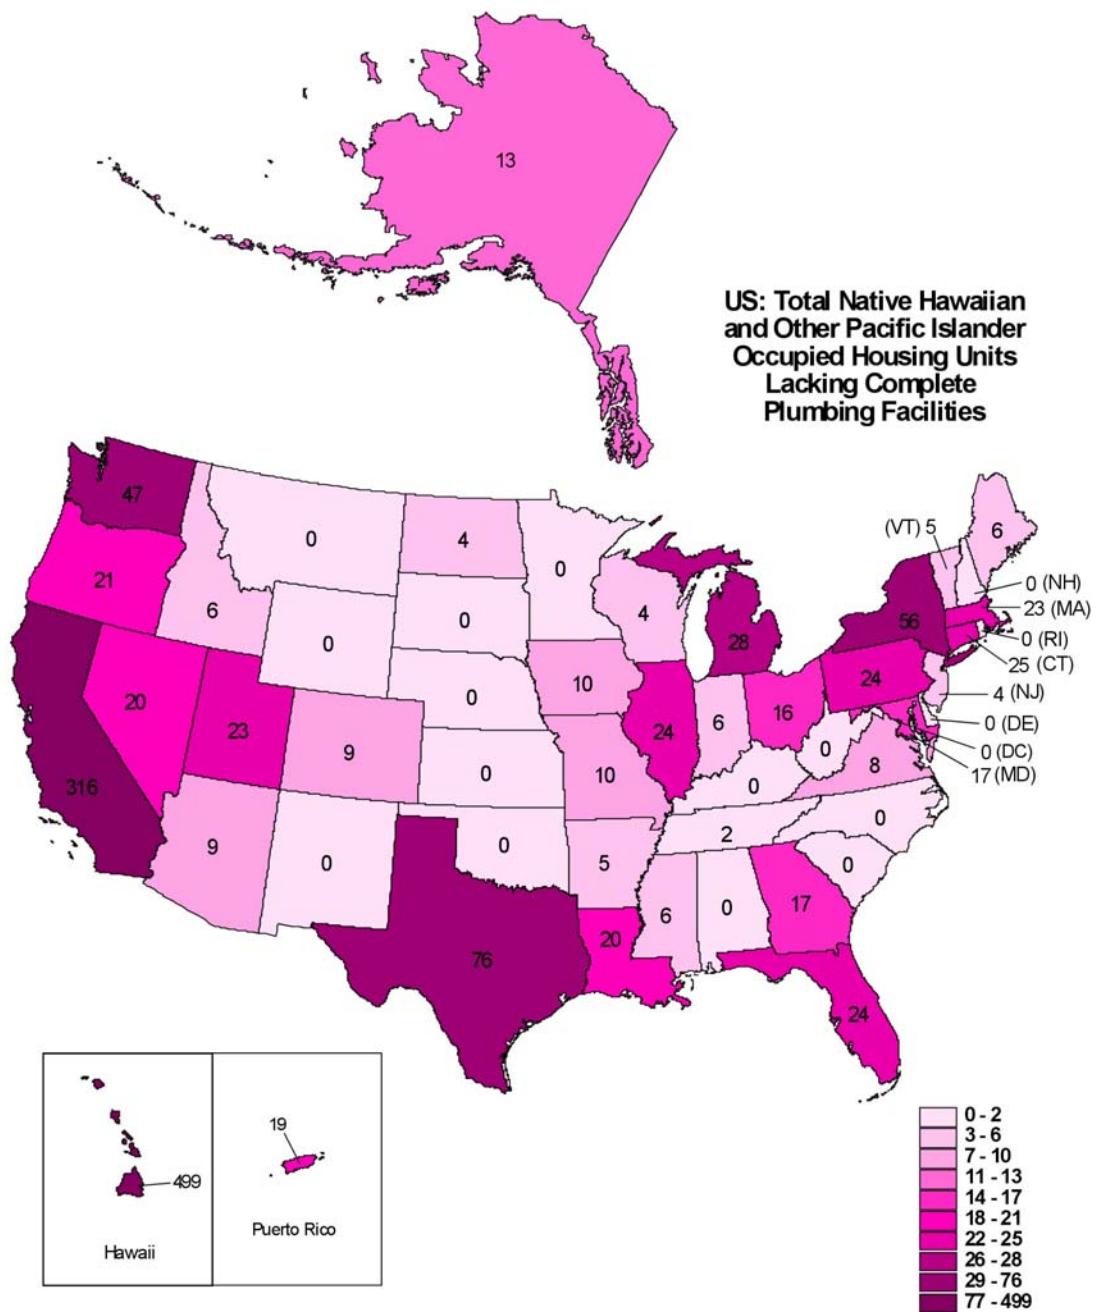

yet more than 670,000 households—close to 2 million people—still lack these very basic services. Getting water to this population will require explicitly addressing the environmental justice issues that are embedded in social and economic frameworks related to access to water services. In addition, as costs of managing water systems rise, more low-income residents will be hardpressed to pay water bills, even as the states are cutting programs that subsidize low-income residents. Ultimately, a significant effort that draws on government and private resources is needed to address the gap in water service and make certain it slows in the next decade.

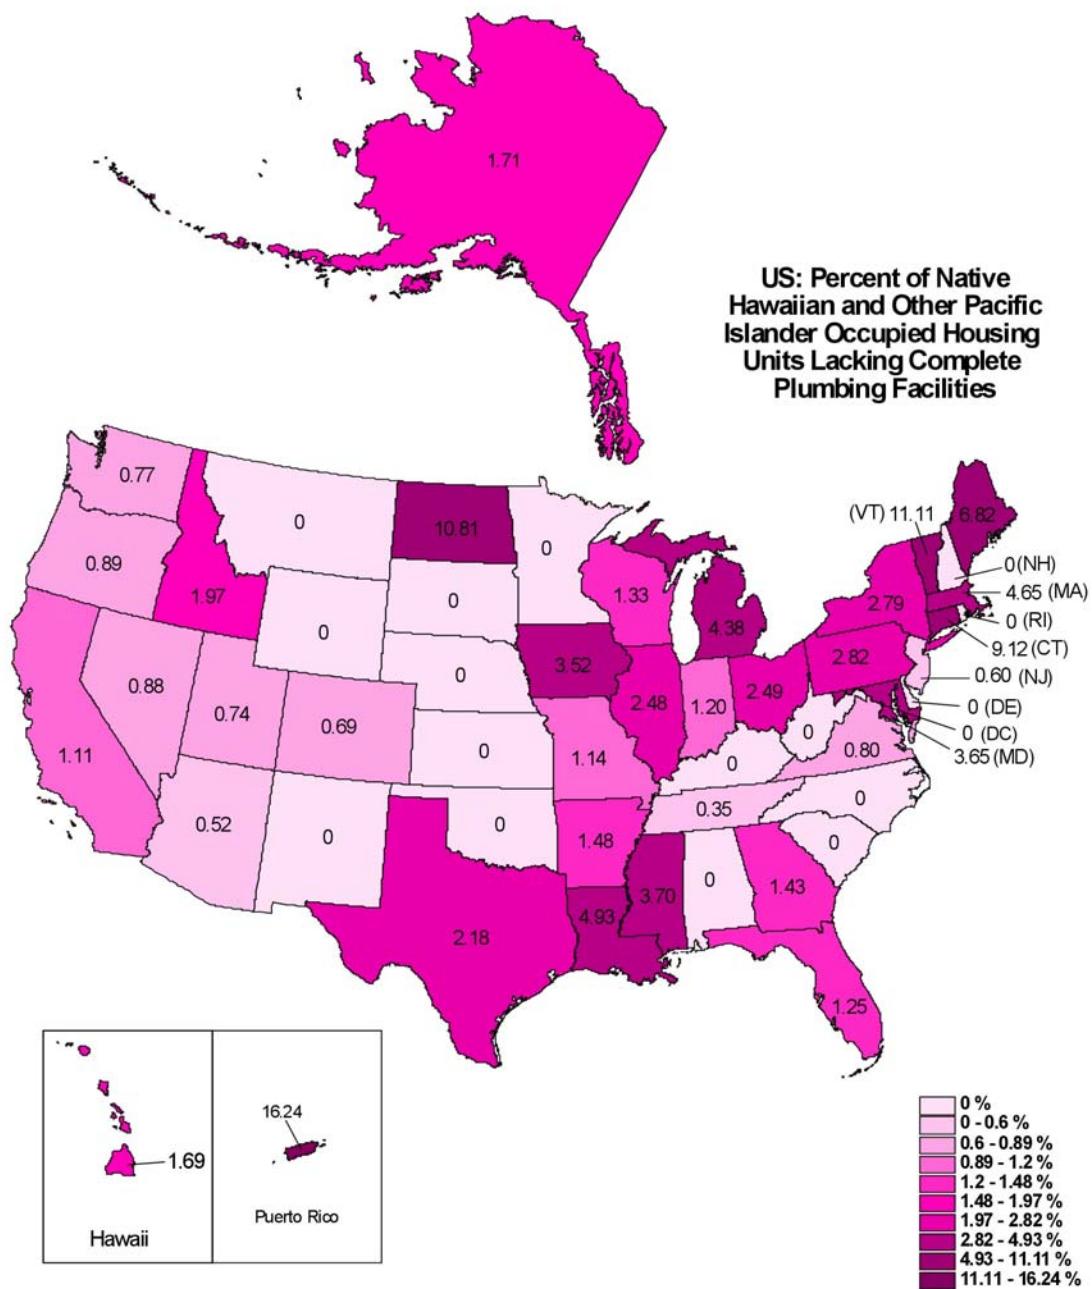

This report shows that the lack of plumbing services is still very real for almost 2 million Americans. While the rural-urban divide in the provision of these services has narrowed in the last decade, it persists and is intrinsically related to the socioeconomic status of the people who lack these services. Rural populations are still at a larger risk of lacking proper services, as infrastructure ages and traditional funding for improvement programs is slowly being reduced. Across the United States, in general, minority communities are affected more acutely. There are wide fluctuations across geographic locations and areas. Some prominent areas are the Four Corners region and the underserved parts of the Northeast and the South. Alaska stands out as a single state that needs much improvement in infrastructure. Given Alaska's unique condition, policy makers must pay attention to enhancing services there that are socially acceptable, economically feasible, and environmentally sustainable.

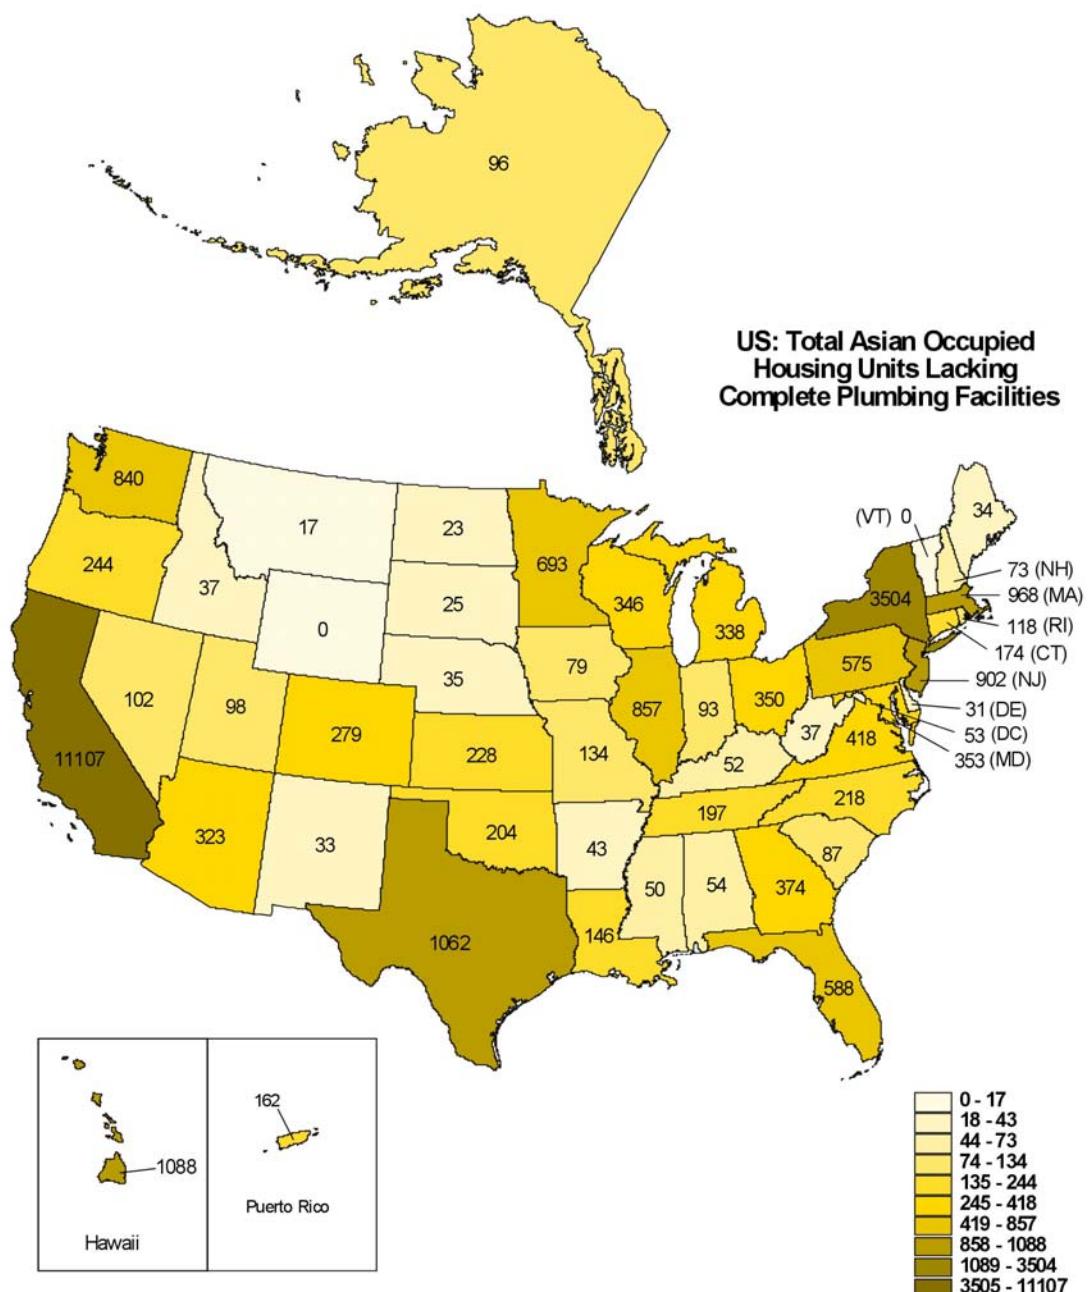

A closer look at the numbers within states, at the county or Census-designated place levels, provides a clearer understanding of the reality of lack in plumbing services. The information at the substate level, disaggregated, also allows for relative geographic comparisons within and among states and permits a clearer comprehension of the larger nationwide picture. Our hypothesis and affirmed assumptions are based on this examination and understanding of the numbers at the disaggregated level, which are shown in the pages ahead and which the readers might find useful.

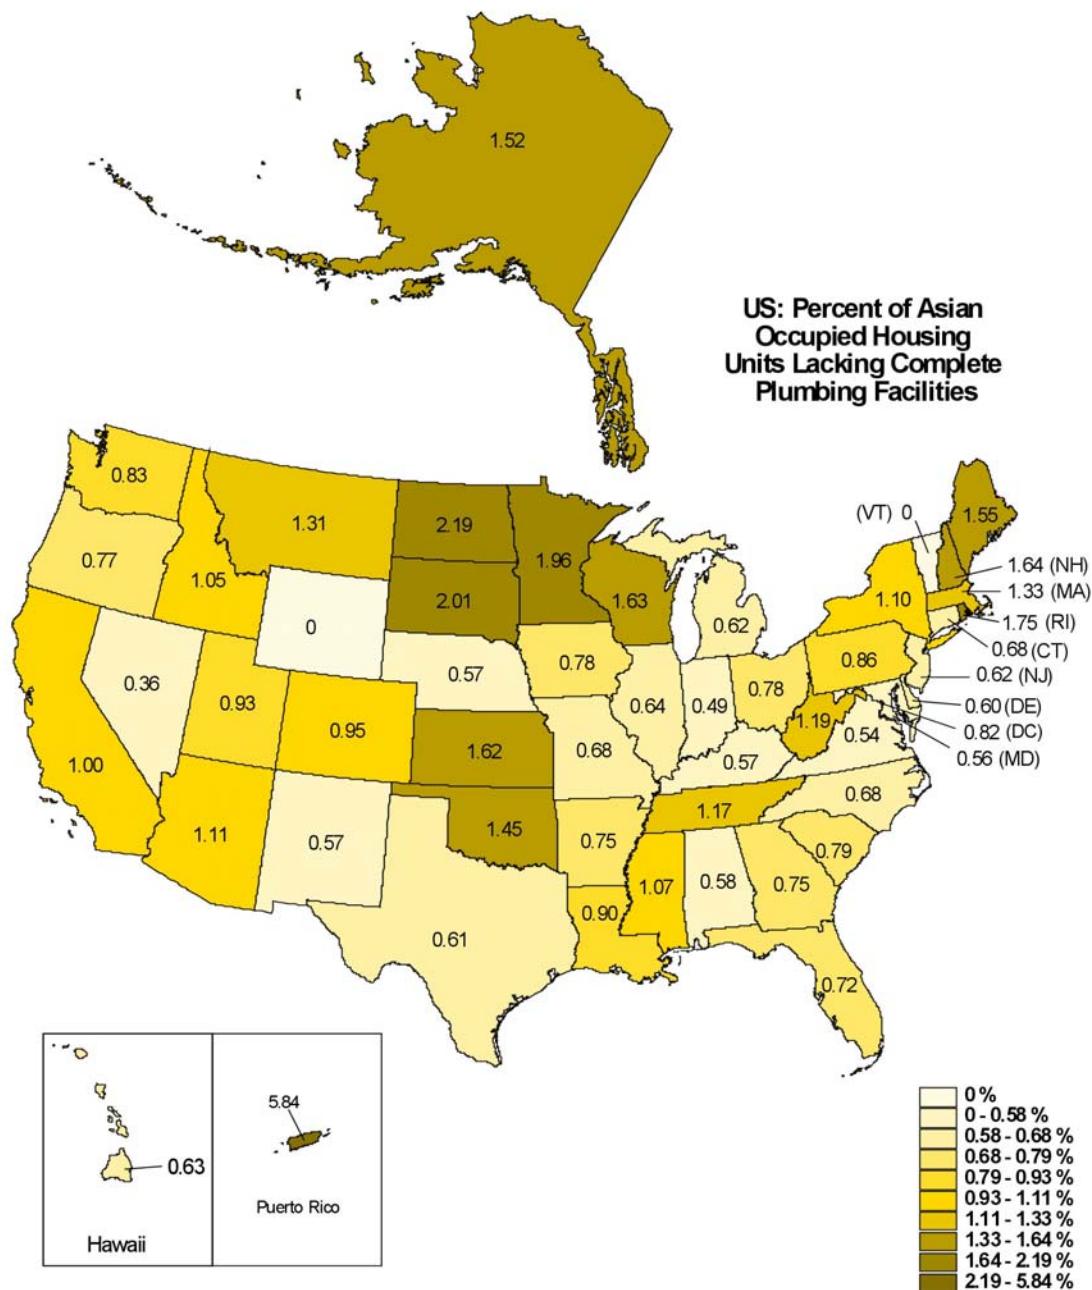

In the future, we hope to take this research toward a more complex analysis of the links among social, economic, geographic, environmental, and public health variables that affect the positive outcomes in services for traditionally and currently underserved communities. Our findings will allow us to understand better how to enhance communities' capacity for improving infrastructure and services and ultimately achieving sustainable development.

The following maps and ranking tables disaggregate the population without plumbing for all states at the county level and for the D.C., Puerto Rico, and the island areas to the Census designated place (CDP) level.

# State-by-State Analysis at County Level

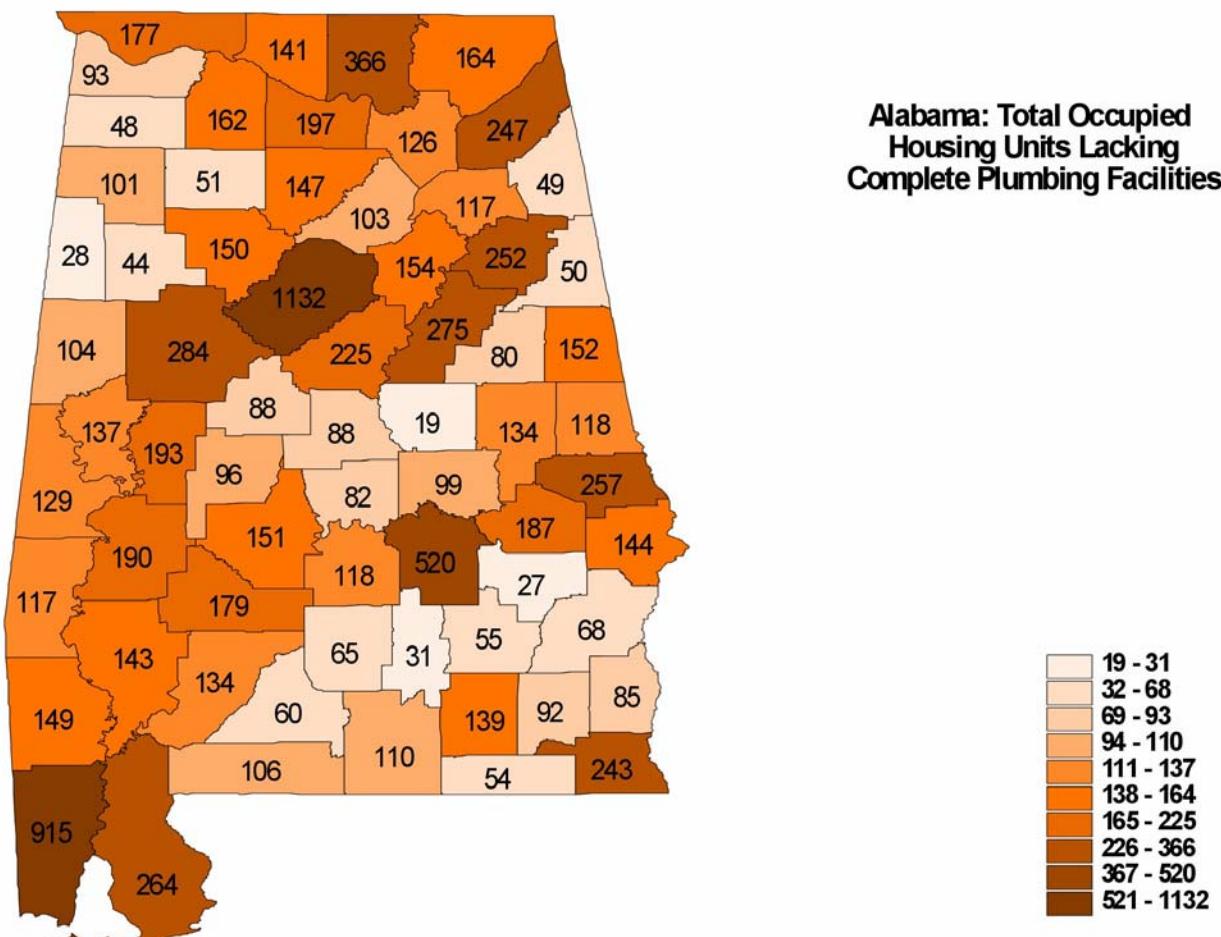

## Explanation of Terms

Abbreviation	Full Term	Explanation
HU	Housing Unit	A housing unit is defined by the U.S. Census 2000 as: "A house, an apartment, a mobile home or trailer, a group of rooms, or a single room occupied as separate living quarters, or if vacant, intended for occupancy as separate living quarters. Separate living quarters are those in which the occupants live separately from any other individuals in the building and which have direct access from outside the building or through a common hall. For vacant units, the criteria of separateness and direct access are applied to the intended occupants whenever possible." This is the same definition which applies to all housing units shown in the tables in this report.
OHU	Occupied Housing Units	This denotes all the housing units that were occupied at the time of the census (both for 1990 and 2000 censuses).
OHULP	Occupied Housing Units Lacking Complete Plumbing Facilities	This denotes all the occupied housing units, at the time of the census, that lacked complete plumbing facilities. "Lacking complete plumbing facilities" indicates lack of <b>any</b> of the three following facilities <b>inside</b> the housing unit (this the same for the 1990 and 2000 censuses): 1) Hot and cold piped water 2) Bathtub or shower 3) Flush toilet
%OHULP	Percentage of Occupied Housing Units Lacking Complete Plumbing Facilities	This is the percentage of occupied housing units (i.e. as a percentage of the total occupied housing units) that lack complete plumbing facilities. This is calculated as: $\left( \frac{\text{OHULP}}{\text{OHU}} \right) \times 100 = \% \text{ OHULP}$
ROHU	Rural Occupied Housing Units	This denotes all the rural occupied housing units. The U.S. Census 2000 defines all territories, population and housing units to be rural which are not classified as "urban". (For a detailed definition of "urban", please look at the glossary.)
ROHULP	Rural Occupied Housing Units Lacking Complete Plumbing Facilities	This denotes all the rural occupied housing units, at the time of the census, that lacked complete plumbing facilities.
%ROHULP	Percentage of Rural Occupied Housing Units Lacking Complete Plumbing Facilities	This is the percentage of rural occupied housing units (i.e. as a percentage of the total rural occupied housing units) that lack complete plumbing facilities. This is calculated as: $\left( \frac{\text{ROHULP}}{\text{ROHU}} \right) \times 100 = \% \text{ ROHULP}$

<b>Abbreviation</b>	<b>Full Term</b>	<b>Explanation</b>
OHULP with Householder below Poverty Level in 1999	Occupied Housing Units Lacking Complete Plumbing Facilities, with Householder having Income in 1999 below the Poverty Level	This denotes all the occupied housing units that lack complete plumbing facilities, with householder having an income in 1999 below the poverty level. (For a detailed description of “poverty level” please see the definition for “poverty” in the glossary.)
Percent of OHULP below poverty level in 1999	Percentage of Occupied Housing Units Lacking Complete Plumbing Facilities, with Householder having Income in 1999 below the Poverty Level	This is the percentage of occupied housing units that lack complete plumbing facilities, and having a householder with an income in 1999 below the poverty level. The percentage is calculated as:
		$\left( \frac{\text{OHULP below poverty level in 1999}}{\text{OHU below poverty level in 1999}} \right) \times 100 = \% \text{ OHULP below poverty level in 1999}$
Rural OHULP below poverty level in 1999	Rural Occupied Housing Units Lacking Complete Plumbing Facilities, with Householder having Income in 1999 below the Poverty Level	This denotes all the rural occupied housing units that lack complete plumbing facilities, and having a householder with an income in 1999 below the poverty level.
Percent of Rural OHULP below poverty level in 1999	Percentage of Rural Occupied Housing Units Lacking Complete Plumbing Facilities, with Householder having Income in 1999 below the Poverty Level	This is the percentage of rural occupied housing units that lack complete plumbing facilities, and having a householder with an income in 1999 below the poverty level. The percentage is calculated as:
		$\left( \frac{\text{ROHULP below poverty level in 1999}}{\text{ROHU below poverty level in 1999}} \right) \times 100 = \% \text{ ROHULP below poverty level in 1999}$
Percent of population above 65 years in OHULP	Percentage of the Population above 65 years living in Occupied Housing Units Lacking Complete Plumbing Facilities	This denotes the percentage of the population that is above 65 years and is living in occupied housing units lacking complete plumbing facilities. This is calculated as:
		$\left( \frac{\text{Population above 65 years in OHULP}}{\text{Population above 65 years in OHU}} \right) \times 100 = \% \text{ Population above 65 year}$
Total population in OHULP	Total Population in Occupied Housing Units Lacking Complete Plumbing Facilities	This denotes the total number of people living in occupied housing units that lack complete plumbing facilities.

## Glossary of Terms

### **Alaska Native race/ethnic categories**

Self-identification among people of Alaska Native descent. These are the five detailed Alaska Native race and ethnic categories used in tabulating data in the Census 2000:

- Alaska Athabaskan
- Aleut
- Eskimo
- Tlingit-Haida
- All other tribes

### **American Indian tribe/Selected American Indian categories**

Self-identification among people of American Indian descent. Many American Indians are members of a principal tribe or group empowered to negotiate and make decisions on behalf of the individual members. Census 2000 data are available for 36 tribes or selected American Indian categories:

Apache	Houma	Pueblo
Blackfeet	Iroquois	Puget Sound Salish
Cherokee	Kiowa	Seminole
Cheyenne	Latin American (Aztec,	Shoshone
Chickasaw	Inca, Mayan, etc.)	Sioux
Chippewa	Lumbee	Tohomo O'Odham
Chocktaw	Menominee	Ute
Colville	Navajo	Yakama
Comanche	Osage	Yaqui
Cree	Ottawa	Yuman
Creek	Paiute	All other
Crow	Pima	
Delaware	Potawatomi	

These tribes were selected based on a 1990 population threshold of 7,500.

Related term: Race

### **Asian**

Self-identification among people of Asian descent. There are 17 detailed Asian race and ethnic categories used in for tabulating data in the Census 2000:

Asian Indian	Indonesian	Sri Lankan
Bangladeshi	Japanese	Taiwanese
Cambodian	Korean	Thai
Chinese, except Taiwanese	Laotian	Vietnamese
Filipino	Malaysian	Other Asian
Hmong	Pakistani	

Related term: Race

### **Borough**

A county equivalent in Alaska, a minor civil division in New York, and an incorporated place in Connecticut, New Jersey, and Pennsylvania.

## **Central place**

The core incorporated place(s) or a census designated place of an urban area, usually consisting of the most populous place(s) in the urban area plus additional places that qualify under Census Bureau criteria. If the central place is also defined as an extended place, only the portion of the central place contained within the urban area is recognized as the central place.

## **Census**

A complete enumeration, usually of a population, but also of businesses and commercial establishments, farms, governments, and so forth.

### **Census (decennial)**

The census of population and housing, taken by the Census Bureau in years ending in 0 (zero). Article I of the Constitution requires that a census be taken every ten years for the purpose of reapportioning the U.S. House of Representatives.

## **Census area**

The statistical equivalent of a county in Alaska. Census areas are delineated cooperatively by the state of Alaska and the Census Bureau for statistical purposes in the portion of Alaska not within an organized borough.

### **Census county division (CCD)**

A subdivision of a county that is a relatively permanent statistical area established cooperatively by the Census Bureau and state and local government authorities. Used for presenting decennial census statistics in those states that do not have well-defined and stable minor civil divisions that serve as local governments.

### **Census designated place (CDP)**

A statistical entity, defined for each decennial census according to Census Bureau guidelines, comprising a densely settled concentration of population that is not within an incorporated place, but is locally identified by a name. CDPs are delineated cooperatively by state and local officials and the Census Bureau, following Census Bureau guidelines. Beginning with Census 2000 there are no size limits.

Related term: Incorporated place

## **Central city**

The largest city of a Metropolitan area (MA). Central cities are a basis for establishment of an MA. Additional cities that meet specific criteria also are identified as central cities. In a number of instances, only part of a city qualifies as central, because another part of the city extends beyond the MA boundary.

Related term: Metropolitan area (MA)

## **City**

A type of incorporated place in 49 states and the District of Columbia. In 23 states and the District of Columbia, some or all cities are not part of any Minor Civil Division (MCD), and the Census Bureau also treats these as county subdivisions, statistically equivalent to MCDs.

Related terms: Incorporated place, Minor civil division (MCD)

**Comunidad**

Represents a census designated place that is not the representing governmental center of the municipio in Puerto Rico. There are no incorporated places in Puerto Rico. For Census 2000 there are no minimum population requirements. For 1990 comunidades had to have at least 1,000 people.

Related term: Municipio

**Confidentiality**

The guarantee made by law (Title 13, United States Code) to individuals who provide census information regarding nondisclosure of that information to others.

For US Code, Title 13, see

[http://factfinder.census.gov/home/en/epss/glossary\\_t.html#title\\_13\\_u.s.\\_code](http://factfinder.census.gov/home/en/epss/glossary_t.html#title_13_u.s._code)

**Consolidated city**

An incorporated place that has combined its governmental functions with a county or sub-county entity but contains one or more other incorporated places that continue to function as local governments within the consolidated government.

Related term: Incorporated place

**Consolidated metropolitan statistical area (CMSA)**

A geographic entity defined by the federal Office of Management and Budget for use by federal statistical agencies. An area becomes a CMSA if it meets the requirements to qualify as a metropolitan statistical area, has a population of 1,000,000 or more, if component parts are recognized as primary metropolitan statistical areas, and local opinion favors the designation.

Related terms: Metropolitan statistical area (MSA), Primary metropolitan statistical area (PMSA)

**County and equivalent entity**

The primary legal subdivision of most states. In Louisiana, these subdivisions are known as parishes. In Alaska, which has no counties, the county equivalents are boroughs, a legal subdivision, and census areas, a statistical subdivision. In four states (Maryland, Missouri, Nevada and Virginia), there are one or more cities that are independent of any county and thus constitute primary subdivisions of their states. The District of Columbia has no primary divisions, and the entire area is considered equivalent to a county for statistical purposes. In Puerto Rico, municipios are treated as county equivalents.

Related term: Borough

**County subdivision**

A legal or statistical division of a county recognized by the Census Bureau for data presentation. The two major types of county subdivisions are census county divisions and minor civil divisions.

Related terms: Minor civil division (MCD), Unorganized territory

### **Householder**

The person, or one of the people, in whose name the home is owned, being bought, or rented. If there is no such person present, any household member 15 years old and over can serve as the householder for the purposes of the census.

### **Housing unit**

A house, an apartment, a mobile home or trailer, a group of rooms, or a single room occupied as separate living quarters, or if vacant, intended for occupancy as separate living quarters. Separate living quarters are those in which the occupants live separately from any other individuals in the building and which have direct access from outside the building or through a common hall. For vacant units, the criteria of separateness and direct access are applied to the intended occupants whenever possible.

### **Hispanic or Latino origin**

For Census 2000, American Community Survey: People who identify with the terms "Hispanic" or "Latino" are those who classify themselves in one of the specific Hispanic or Latino categories listed on the Census 2000 or ACS questionnaire—"Mexican," "Puerto Rican," or "Cuban"—as well as those who indicate that they are "other Spanish, Hispanic, or Latino." Origin can be viewed as the heritage, nationality group, lineage, or country of birth of the person or the person's parents or ancestors before their arrival in the United States. People who identify their origin as Spanish, Hispanic, or Latino may be of any race.

1990 Census of Population and Housing: A self-designated classification for people whose origins are from Spain, the Spanish-speaking countries of Central or South America, the Caribbean, or those identifying themselves generally as Spanish, Spanish-American, etc. Origin can be viewed as ancestry, nationality, or country of birth of the person or person's parents or ancestors prior to their arrival in the United States.

### **Income**

"Total income" is the sum of the amounts reported separately for wages, salary, commissions, bonuses, or tips; self-employment income from own non-farm or farm businesses, including proprietorships and partnerships; interest, dividends, net rental income, royalty income, or income from estates and trusts; Social Security or Railroad Retirement income; Supplemental Security Income (SSI); any public assistance or welfare payments from the state or local welfare office; retirement, survivor, or disability pensions; and any other sources of income received regularly such as Veterans' (VA) payments, unemployment compensation, child support, or alimony.

### **Incorporated place**

A type of governmental unit incorporated under state law as a city, town (except the New England states, New York, and Wisconsin), borough (except in Alaska and New York), or village and having legally prescribed limits, powers, and functions.

Related terms: Census designated place (CDP), Place

## **Living quarters**

A housing unit is a house, an apartment, a mobile home or trailer, a group of rooms or a single room occupied as separate living quarters or, if vacant, intended for occupancy as separate living quarters. Separate living quarters are those in which the occupants live separately from any people in the building and which have direct access from outside the building or through a common hall.

Related term: Housing unit

## **Long form**

The decennial census questionnaire, sent to approximately one in six households for the 1980, 1990, and 2000 censuses, contains all of the questions on the short form, as well as additional detailed questions relating to the social, economic, and housing characteristics of each individual and household. Information derived from the long form is referred to as sample data, and is tabulated for geographic entities as small as the block group level in 1980, 1990, and 2000 census data products.

Related terms: Census (decennial), Sample data, Short form

## **Metropolitan**

Refers to those areas surrounding large and densely populated cities or towns.

## **Metropolitan area (MA)**

A collective term, established by the federal Office of Management and Budget, to refer to metropolitan statistical areas, consolidated metropolitan statistical areas, and primary metropolitan statistical areas.

## **Metropolitan statistical area (MSA)**

A geographic entity defined by the federal Office of Management and Budget for use by federal statistical agencies, based on the concept of a core area with a large population nucleus, plus adjacent communities having a high degree of economic and social integration with that core. Qualification of an MSA requires the presence of a city with 50,000 or more inhabitants, or the presence of an Urbanized Area (UA) and a total population of at least 100,000 (75,000 in New England). The county or counties containing the largest city and surrounding densely settled territory are central counties of the MSA. Additional outlying counties qualify to be included in the MSA by meeting certain other criteria of metropolitan character, such as a specified minimum population density or percentage of the population that is urban. MSAs in New England are defined in terms of minor civil divisions, following rules concerning commuting and population density.

Related terms: Consolidated metropolitan statistical area (CMSA), Primary metropolitan statistical area (PMSA)

## **Minor civil division (MCD)**

A primary governmental and/or administrative subdivision of a county, such as a township, precinct, or magisterial district. MCDs exist in 28 states and the District of Columbia. In 20 states, all or many MCD's are general-purpose governmental units: Connecticut, Illinois, Indiana, Kansas, Maine, Massachusetts, Michigan, Minnesota, Missouri, Nebraska, New Hampshire, New Jersey, New York, North Dakota, Ohio, Pennsylvania, Rhode Island, South Dakota, Vermont, and Wisconsin. Most of these MCD's are legally designated as towns or townships.

Related Terms: Census county division (CCD), County subdivision, Unorganized territory

## Municipio

Primary legal divisions of Puerto Rico. These are treated as county equivalents.

## Native Hawaiian and Pacific Islander race and ethnic categories

Self-identification among people of Native Hawaiian and Pacific Islander descent. These are the 12 detailed Native Hawaiian and Pacific Islander race and ethnic categories used in displaying data from Census 2000:

Polynesian:	Micronesian:	Melanesian:
Native Hawaiian	Guanamanian or	Fijian
Samoan	Chamorro	Other Melanesian
Tongan	Other Micronesian	Other Pacific Islander
Other Polynesian		

## Nonmetropolitan

The area and population not located in any Metropolitan area (MA).

## Occupied housing unit

A housing unit is classified as occupied if it is the usual place of residence of the person or group of people living in it at the time of enumeration.

## Parish

A type of governmental unit that is the primary legal subdivision of Louisiana, similar to a county in other states.

## Place

A concentration of population either legally bounded as an incorporated place, or identified as a Census Designated Place (CDP) including comunidades and zonas urbanas in Puerto Rico. Incorporated places have legal descriptions of borough (except in Alaska and New York), city, town (except in New England, New York, and Wisconsin), or village.

Related terms: Census designated place (CDP), City, Comunidad, Incorporated place, Town, Zona urbana

## Plumbing facilities

The data on plumbing facilities were obtained from both occupied and vacant housing units. Complete plumbing facilities include: (1) hot and cold piped water; (2) a flush toilet; and (3) a bathtub or shower. All three facilities must be located in the housing unit.

## Population

All people, male and female, child and adult, living in a given geographic area.

## Population density

Total population or number of housing units within a geographic entity (for example, United States, state, county, place) divided by the land area of that entity measured in square kilometers or square miles. Density is expressed as both "people (or housing units) per square kilometer" and "people (or housing units) per square mile" of land area.

## Poverty

Following the Office of Management and Budget's (OMB's) Directive 14, the Census Bureau uses a set of money income thresholds that vary by family size and composition to detect who is poor. If

the total income for a family or unrelated individual falls below the relevant poverty threshold, then the family or unrelated individual is classified as being "below the poverty level."

For a detailed description of how the poverty level is determined, see:  
<http://www.census.gov/hhes/poverty/povdef.html>

Related term: Income

### **Primary metropolitan statistical area (PMSA)**

A geographic entity defined by the federal Office of Management and Budget for use by federal statistical agencies. If an area meets the requirements to qualify as a metropolitan statistical area and has a population of one million or more, two or more PMSAs may be defined within it if statistical criteria are met and local opinion is in favor. A PMSA consists of one or more counties (county subdivisions in New England) that have substantial commuting interchange. When two or more PMSAs have been recognized, the larger area of which they are components then is designated a consolidated metropolitan statistical area.

Related terms: Consolidated metropolitan statistical area (CMSA), Metropolitan statistical area (MSA)

### **Puerto Rico**

The U.S. Census Bureau treats the Commonwealth of Puerto Rico as the equivalent of a state for data presentation purposes. Puerto Rico is divided into legal government municipios, which are statistically equivalent to counties.

### **Race**

Race is a self-identification data item in which respondents choose the race or races with which they most closely identify.

*For Census 2000:*

In 1997, after a lengthy analysis and public comment period, the Federal Office of Management and Budget (OMB) revised the standards for how the Federal government would collect and present data on race and ethnicity.

These new guidelines revised some of the racial categories used in 1990 and preceding censuses and allowed respondents to report as many race categories as were necessary to identify themselves on the Census 2000 questionnaire. The full report is available at  
<http://www.whitehouse.gov/omb/inforeg/race.pdf>.

*How the new guidelines affect Census 2000 results and the comparison with data from 1990:*

Census 2000 race data are not directly comparable with data from 1990 and previous censuses. See the Census 2000 Brief, "Overview of Race and Hispanic Origin" at  
<http://www.census.gov/prod/2001pubs/c2kbr01-1.pdf>.

Race Alone categories (6):

Includes the minimum five race categories required by OMB, plus the ‘some other race alone’ included by the Census Bureau for Census 2000, with the approval of OMB.

- White alone
- Black or African-American alone
- American Indian or Alaska Native alone
- Asian alone
- Native Hawaiian or other Pacific Islander alone
- Some other race alone

Race Alone or in combination categories (63):

There are other tabulations where ‘race alone or in combination’ are shown. These tabulations include not only persons who marked only one race (the ‘race alone’ category) but also those who marked that race and at least one other race. For example, a person who indicated that she was of Filipino and African-American background would be included in the African-American alone or in combination count, as well as in the Asian alone or in combination count. The alone or in combination totals are tallies of responses, rather than respondents. So the sum of the race alone or in combination will add to more than the total population.

Some tabulations show the number of persons who checked ‘two or more races’.

In some tables, including the first release of Census 2000 information, data is tabulated for 63 possible combinations of race:

- 6 race alone categories
- 15 categories of 2 races (e.g., White and African American, White and Asian, etc.)
- 20 categories of 3 races
- 15 categories of 4 races
- 6 categories of 5 races
- 1 category of 6 races
- =63 possible combinations

Some tables show data for seven race categories: the six (mutually exclusive) major race-alone categories (White, African-American, American Indian and Alaska Native, Asian, Native Hawaiian and Other Pacific Islander, and some other race) and a ‘two or more races’ category. The sum of these seven categories adds to 100 percent of the population.

Related terms: Alaska Native race/ethnic categories, American Indian tribe/Selected American Indian categories, Asian, Native Hawaiian and Pacific Islander race and ethnic categories, Spanish/Hispanic/Latino

**Rural**

Territory, population and housing units not classified as urban. “Rural” classification cuts across other hierarchies and can be in metropolitan or non-metropolitan areas.

Related terms: Urban, Metropolitan

**Sample data**

Population and housing information collected from the census long form for a one in six sample of households in the United States and Puerto Rico, and on a continuous basis for selected areas in the American Community Survey.

Related terms: Census (decennial), Long form

## Short Form

The decennial census questionnaire, sent to approximately five of six households for the 1980, 1990, and 2000 censuses. For Census 2000, the questionnaire asked population questions related to household relationship, sex, race, age and Hispanic or Latino origin and housing questions related to tenure, occupancy, and vacancy status. The 1990 short form contained a question on marital status. The questions contained on the short form also are asked on the long form, along with additional questions.

Related terms: Census (decennial), Long form

## Spanish/Hispanic/Latino

For Census 2000 and the American Community Survey: People who identify with the terms "Hispanic" or "Latino" are those who classify themselves in one of the specific Hispanic or Latino categories listed on the Census 2000 or ACS questionnaire—"Mexican," "Puerto Rican," or "Cuban"—as well as those who indicate that they are "other Spanish, Hispanic, or Latino." Origin can be viewed as the heritage, nationality group, lineage, or country of birth of the person or the person's parents or ancestors before their arrival in the United States. People who identify their origin as Spanish, Hispanic, or Latino may be of any race.

For 1990 Census of Population and Housing:

A self-designated classification for people whose origins are from Spain, the Spanish-speaking countries of Central or South America, the Caribbean, or those identifying themselves generally as Spanish, Spanish-American, etc. Origin can be viewed as ancestry, nationality, or country of birth of the person or person's parents or ancestors prior to their arrival in the United States.

## Spanish/Hispanic/Latino people may be of any race.

Listed below are the 28 Hispanic or Latino categories used in Census 2000 tabulations:

Mexican	South American:	Other Hispanic or Latino:
Puerto Rican	Argentinian	Spaniard
Cuban	Bolivian	Spanish
Dominican Republic	Chilean	Spanish American
Central American:	Colombian	All other Hispanic or
Costa Rican	Ecuadorian	Latino
Guatemalan	Paraguayan	
Honduran	Peruvian	
Nicaraguan	Uruguayan	
Panamanian	Venezuelan	
Salvadoran	Other South American	
Other Central American		

## Summary File 3 (SF 3)

This file presents data on the population and housing long form subjects such as income and education. It includes population totals for ancestry groups. It also includes selected characteristics for a limited number of race and Hispanic or Latino categories. The data are available for the U.S., regions, divisions, states, counties, county subdivisions, places, census tracts, block groups, metropolitan areas, American Indian and Alaska Native areas, tribal subdivisions, Hawaiian home lands, congressional districts, and Zip Code Tabulation Areas.

Related term: Long form

## **Town**

A type of minor civil division in the New England states, New York, and Wisconsin and a type of incorporated place in 30 states and the Virgin Islands of the United States.

Related term: County subdivision

## **Unorganized Territory**

Occur in 10 minor civil division (MCD) states where portions of counties are not included in any legally established MCD or independent incorporated place. The pieces are recognized as one or more separate county subdivisions for statistical data presentation purposes.

## **Urban**

All territory, population and housing units in urbanized areas and in places of more than 2,500 persons outside of urbanized areas. "Urban" classification cuts across other hierarchies and can be in metropolitan or non-metropolitan areas.

Related terms: Metropolitan, Rural

## **Urban Area**

Collective term referring to all areas that are urban. For Census 2000, there are two types of urban areas: urban clusters and urbanized areas.

## **Urban Cluster**

A densely settled territory that has at least 2,500 people but fewer than 50,000. This is new for Census 2000.

## **Urbanized area (UA)**

An area consisting of a central place(s) and adjacent territory with a general population density of at least 1,000 people per square mile of land area that together have a minimum residential population of at least 50,000 people. The Census Bureau uses published criteria to determine the qualification and boundaries of UAs.

## **Usual residence**

The living quarters where a person spends more nights during a year than any other place.

Related term: Living quarters

## **Usual residence elsewhere**

A housing unit temporarily occupied at the time of enumeration entirely by people with a usual residence elsewhere is classified as vacant. The occupants are classified as having a "Usual residence elsewhere" and are counted at the address of their usual place of residence.

## **Village**

A type of incorporated place in 20 states and American Samoa. The Census Bureau treats all villages in New Jersey, South Dakota, and Wisconsin and some villages in Ohio as county subdivisions.

## **Zona Urbana**

Represents a census designated place that is the governmental center of each municipio in Puerto Rico. There are no incorporated places in Puerto Rico.

Related term: Municipio
